

BEAM Plus New Buildings

Version 2.0
(Beta 0)
(2018.12)

Disclaimers of the draft of BEAM Plus NB v2.0 (Beta 0)

The BEAM Plus New Buildings V2.0 (Beta 0) version is released as a consultation document for stakeholders' engagement purpose. This must not be taken as an official launch of the final version which is subject to changes in due course.

In no circumstances shall a reader rely on this version for any purpose other than treating this as a consultation document.

BEAM Society Limited and its commissioned consultants for this Major Revision accept no liability for any loss or damage arising from any use or misuse of or reliance on any information in this draft manual.

Credit 12	Operator Training plus Chemical Storage and Mixing Room
Credit 13	Digital Facility Management Interface
Credit 14	Occupant Engagement Platform
Credit 15	Document Management System
Credit 16	BIM Integration

Table of Content

3. Sustainable Site (SS)

Prerequisite 1	Minimum Landscaping Requirements
Credit 1	Pedestrian-oriented and Low Carbon Transport
Credit 2	Neighbourhood Amenities
Credit 3	Building Design for Sustainable Urbanism
Credit 4	Neighbourhood Daylight Access
Credit 5	Noise Control for Building Equipment
Credit 6	Light Pollution Control
Credit 7	Ecological Preservation/ Enhancement
Credit 8	Urban Heat Island Mitigation
Credit 9	Immediate Neighbourhood Wind Environment
Credit 10	Outdoor Thermal Comfort
Credit 11	Stormwater Management
Credit 12	Design for Climate Change Adaptation

4. Materials and Waste (MW)

Prerequisite 1	Minimum Waste Handling Facilities
Credit 1	Building Re-use
Credit 2	Modular and Standardised Design
Credit 3	Prefabrication
Credit 4	Design for Durability and Resilience
Credit 5	Sustainable Forest Products
Credit 6	<i>Recycled Materials</i>
Credit 7	Ozone Depleting Substances
Credit 8	<i>Regional Materials</i>
Credit 9	Use of Certified Green Products
Credit 10	Life Cycle Assessment
Credit 11	Adaptability and Deconstruction
Credit 12	Enhanced Waste Handling Facilities

Table of Content**5. Energy Use (EU)**

Prerequisite 1	Minimum Energy Performance
Credit 1	Low Carbon Passive Design
Credit 2	Reduction of CO ₂ Emissions
Credit 3	Peak Electricity Demand Reduction
Credit 4	Metering and Monitoring
Credit 5	Renewable And Alternative Energy Systems
Credit 6	Air-Conditioning Units
Credit 7	Clothes Drying Facilities
Credit 8	Energy Efficient Appliances

6. Water Use (WU)

Prerequisite 1	Minimum Water Saving Performance
Credit 1	Annual Water Use
Credit 2	Water Efficient Irrigation
Credit 3	Water Efficient Appliances
Credit 4	Water Leakage Detection
Credit 5	Twin Tank System
Credit 6	Cooling Tower Water
Credit 7	Effluent Discharge to Foul Sewers
Credit 8	Water Harvesting and Recycling

7. Health and Wellbeing (HWB)

Prerequisite 1	Minimum Ventilation Performance
Credit 1	Healthy and Active Living
Credit 2	<i>Biophilic Design</i>
Credit 3	Inclusive Design
Credit 4	Ventilation

Table of Content

Appendix 4 – Space Type

Note:

🔍 Credit requires *site* audit.

Introduction

Building Environmental Assessment Method (BEAM) Plus is a comprehensive environmental assessment scheme for buildings which is carried out on a voluntary basis. The BEAM Plus family defines best practice criteria for a range of sustainability issues across the whole life-cycle of buildings and projects, such as how buildings should be designed, constructed, operated, etc. Recognised as one of the world's leading green building assessment systems, it provides a comprehensive set of performance standards that can be pursued by developers and owners.

Owned and operated by the BEAM Society Limited (BSL), BEAM Plus New Buildings is one of a series of rating systems that cover the design and construction of new buildings.

Based on the awarded credits where standard or defined performance criteria are satisfied, the project will be graded Platinum, Gold, Silver or Bronze reflecting the overall performance.

BEAM Plus New Buildings Version 2.0 (NB v2.0)

The new BEAM Plus rating tool (New Buildings Version 2.0, NBv2.0) aims to be practical, clear and standardised for defining key elements of green buildings including health and well-being, hygiene, *site* impacts, use of materials, water quality, energy efficiency, indoor environmental quality, etc. During its upgrade process, the following fundamentals were established:

Above Statutory Requirements – Requirements for prerequisites and credits should be set above statutory requirements.

Adaptability – Routes for standard and bespoke building types should be established. Requirements for standard building types should be better defined with more assurance of the applicability of the criteria.

Certainty – Requirements should be clearly defined to reduce ambiguity and promote better certainty in the assessment process. Submittal requirements should be standardised as far as practicable.

Practicality – Standards should be achievable with respect to state-of-the-art of the building industry to promote wider adoption of green building practices but yet pose reasonable challenges for better quality, performance and cost-effectiveness. Submittal requirements at Provisional Assessment Stage should be practicable with respect to normally available design information at the design stage in a typical project timeframe.

It is envisaged that these fundamentals, agreed by the working group, steered the revision of NB v2.0 to a holistic performance indicator and a user-friendly assessment tool.

BEAM Society Limited (BSL)

BSL is committed to promoting and developing the BEAM assessment tools, assessing green buildings and training professionals. BSL owns and operates BEAM Plus and undertakes assessments, training and examinations as a basis for certification and accreditation by the Hong Kong Green Building Council Limited (HKGBC). Oversight of BEAM Plus for New Buildings, including assessment monitoring and deliberation of Credit Interpretation Request (CIR), is performed by the BSL's Technical Review Committee (TRC).

Hong Kong Green Building Council (HKGBC)

HKGBC was established in 2009 as Hong Kong's industry body that coordinates efforts towards green building. HKGBC certifies BEAM Plus projects, accredits BEAM Professional (BEAM Pro), BEAM Affiliate (BA) and BEAM Assessors (BAS).

Development of BEAM Plus NB Version 2.0

The development of BEAM Plus NB Version 2.0 (NB v2.0) was led by a BSL Steering Committee comprising industry practitioners and experts. Industry

stakeholders have been consulted via engagement workshops for feedback and opinion on areas including but not limited to the overall framework, performance categories and their relative emphasis, assessment criteria, submission requirement and grading methodology. The Steering Committee comprises:
 Convenor – Sr Kenneth Chan

Members – Prof CS Poon; CS Wong; John Herbert; KM So; Susan Leung; TT Chow; Alex Leung; Justin Li; Kim Tang Cheuk; Yun Ying Kit, Kenneth; Ivan Fung; Jack Cheng; Ren Chao; Clarence Tze Ka-yan; Dominic Lam; Keith YUE; Kevin Ng; CF Leung; Daniel WT Chan

Advisors – Mr Kevin Leung; Lau Kwok Keung (Main); Patrick Cheung; Stephen Yim Yu-chau

Disclaimer

BEAM Plus has been prepared with the assistance and participation of many individuals and representatives from various organisations. The final outcome represents a general consensus, but unanimous support from each and every organisation and individual consulted is not implied. The BEAM Plus documentation shall be revised on a regular basis and revised as frequently as necessary. BSL reserves the right to amend, update and change this Manual from time to time without prior notice. Where changes in regulations necessitate changes to the assessment criteria, they will be issued to all parties involved in an assessment and will be announced on the BSL's website. An appropriate transitional period shall be allowed for projects undergoing assessment process.

It should be noted that none of the parties involved in the funding of BEAM, including BSL and its members, provide any warranties or assume any liability or responsibility to the users of BEAM, or any third parties for the accuracy, completeness or use of, or reliance on, any information contained in BEAM, or from any injuries, losses, or damages arising out of such use or reliance.

As a condition of use, users covenant not to sue, and agree to waive and release BSL and its members from any and all claims, demands and causes of actions for any injuries, losses and damages that users may now or hereafter have a right to assert against such parties as a result of the use of, or reliance of BEAM.

Limitations

BSL does not endorse any self-assessed grading awarded by the use of BEAM Plus for New Buildings.

HKGBC offers a formal certification process of grading, this service provides independent third party review of credits claimed to ensure all credits can be demonstrated to be achieved by the provision of the necessary documentary evidence. The use of BEAM Plus New Buildings without formal certification does not entitle the user or any other party to promote any grading awarded.

Application and Eligibility

BEAM Plus New Buildings Version 2.0 (NB v2.0) covers the design, construction and associated testing and commissioning of all types of new buildings, from small single building to large buildings, including but not limited to commercial, educational, government, industrial, office and *residential buildings*, hotels and shopping centres, etc.

The assessment needs to cover the various types of premises contained within the development, and may involve premises that are only a 'shell' or are fitted-out. Whatever the circumstances, assessment focuses on what the designer, builder and commissioning agent achieve. Assessment of some aspects of performance may be type dependent, or not feasible for various reasons, so the number of applicable credits and their aggregation will vary.

BEAM Plus does not assess any unauthorised or any unauthorised portions of any buildings, i.e. any buildings or building works not complying with the Buildings

Ordinance. In case any non-compliance works or unauthorised portions in a building are reported, both HKGBC and BSL reserve the right to deprive the awarded rating from the Applicant.

Assessment Boundaries

BEAM Plus New Buildings is concerned about the interactions between the assessed building, neighbouring properties, and the neighbourhood in general. The assessment seeks to reduce negative impacts on neighbours and rewards efforts to improve the quality of the immediate surroundings to the benefit of the neighbourhood: the concept of a ‘good neighbour’.

Certification Framework

Assessment under BEAM Plus for New Buildings covers the demolition planning, design, construction and commissioning of a building and should be initiated in the early stages of project development. BEAM Plus for New Buildings aims to reduce the environmental impacts of new buildings whilst improving quality and user satisfaction, by adoption of the best techniques available within reasonable cost.

According to the emerging international consensus, building assessments should be performance-based as far as possible. Assessment needs to take a holistic view of building performance with emphasis on life-cycle impacts. Assessment purely on the basis of prescriptive features would preclude buildings without the features from obtaining a good assessment result regardless of the actual performance. Furthermore, assessment based on features may encourage feature-based design, construction and operating practices.

A notable attribute of BEAM Plus for New Buildings, as compared with most schemes in use elsewhere, is that an assessment for new buildings is not finalised until a building is completed, ensuring that ‘green’ and ‘sustainable’ design features are actually implemented and construction practice meets the required performance standards. Besides being in the interests of the Client and tenant in certifying the actual performance of the finished product, this approach also serves to ‘dovetail’ assessment with BEAM Plus Existing Buildings and Interiors. It would be expected that a building graded under BEAM Plus for New Buildings and suitably operated, maintained and renovated would achieve a similar grade under other BEAM Plus certification schemes.

Certification Process

BEAM Guidance materials of certification under BEAM Plus New Buildings Version 2.0 (NB v2.0) are available on the HKGBC and BSL website.

Site Audit

BEAM Society Limited (BSL) reserves the right to entitle in process random on-site inspection(s) at any time without advance notice to verify and validate Applicants’ submission. The audit result will be on record and any non-conformance might demand rectification once detected and affect the final assessment.

In the event that this audit is delayed or prevented for any reason, the project may not be certified, and no fees paid shall be refunded.

Certification Fee

BEAM Certification fees for BEAM Plus New Buildings Version 2.0 (NB v2.0) depend on the size and complexity of the project as determined by the HKGBC and BSL. Submission of credit interpretation request (CIR) and Appeals are subject to separate published charges. More details of fee structure can be found in HKGBC and BSL website.

Credit Interpretation Request (CIR)

CIR process is a means whereby Applicants can seek technical and administrative guidance from the BSL TRC on the application of BEAM Plus credits to their projects. Examples may include:

- i. To confirm a technical justification on measurement location and number of point;

- ii. To confirm an alternative compliance approaches in fulfilling the objectives of a particular credit;
- iii. To clarifications of credit options and special circumstances; and
- iv. To petition for higher credit allocation (performance enhancements).

To confirm the equivalent International scheme as an alternatives for achieving the same credit required performance CIR submissions should comprise a method statement identifying the objective of BEAM Plus New Buildings Version 2.0 (NB v2.0) for which credit is being sought, a description of the approach being adopted and, where appropriate, the proposed alternative and method for assessment. More details of CIR can be found in HKGBC and BSL website.

Appeal

The Applicants may submit an appeal on an individual credit should they disagree to and not accept the decision made by the BSL. More details can be found in the HKGBC and BSL websites.

BETA 0

1 Framework

Credit Performance Categories

Different assessment methods assign their aspects under different categories according to the preferences of the tool developer. In BEAM Plus New Buildings Version 2.0 (NB v2.0), aspects are grouped into the following categories:

- i. Integrated Design and Construction Management (IDCM);
- ii. Sustainable Sites (SS);
- iii. Material and Waste (MW);
- iv. Energy Use (EU);
- v. Water Use (WU);
- vi. Health and Wellbeing (HWB); and
- vii. Innovations and Additions (IA).

Whilst BEAM Plus New Buildings Version 2.0 (NB v2.0) adopts similar categories as other versions of BEAM Plus (for existing buildings and interiors), the number and nature of credits within each category is specific to the context of Hong Kong and new building projects.

Integrative Design and Construction Management (IDCM)

IDCM focuses on integration between design and operation, integrated design between design team members and client, and integration throughout process (design to construction). The core objectives of IDCM are presented as follows:

- i. Integrative Design Process;
- ii. Green Construction Practices; and
- iii. Smart Design and Technologies.

Sustainable Sites (SS)

SS focuses on design and planning issues, and the integration of neighbourhood and *site* location. The proposed core objectives of SA are presented as follows:

- i. Neighbourhood Integration;
- ii. Ecological Responsive Design;
- iii. Bioclimatic Design; and
- iv. Climate Resilience and Adaptability.

Material and Waste (MW)

MW focuses on operational materials and waste minimisation. The proposed core objectives of MW are presented as follows:

- i. Materials Use;
- ii. Green Products/ Materials; and
- iii. Waste Reduction.

Energy Use (EU)

EU focuses on building operation energy consumption. It is energy performance based and seeks to encourage quality passive design. The proposed core objectives of EU are presented as follows:

- i. Energy use Reduction and Control;
- ii. Renewable and Alternative Energy Generation; and
- iii. Energy Efficient Equipment.

Water Use (WU)

WU focuses on reduce water consumption. The proposed core objectives of WU are presented as follows:

- i. Water Conservation;
- ii. Effluent; and
- iii. Water Harvesting and Recycling.

Health and Wellbeing (HWB)

HWB focuses on human environmental quality. It is designed to expand the scope of previous indoor environmental quality (IEQ) category and absorb human centric design elements. The proposed core objectives of HWB are presented as follows:

- i. Design for Green Living;
- ii. Inclusive Design; and
- iii. Indoor Environmental Quality.

Innovations and Additions (IA)

IA focuses on promoting and rewarding true innovation. The proposed core objectives of IA are presented as follows:

- i. Innovation Techniques; and
- ii. Innovation Challenges.

Credit Allocation

Credits have been broadly allocated to each assessment criterion by taking into account other internationally recognised green building assessment tools as well as the sensitivity analysis and the comments received during stakeholder engagement workshops.

Category Weighting

Having reviewed local and international assessment schemes and other relevant information, a weighting for each environmental performance category has been assigned to reflect its importance and the global trends as stated as follows:

Category	Weighting
IDCM	18%
SS	15%
MW	9%
EU	29%
WU	7%
HWB	22%

Prerequisites

The Applicant must demonstrate that all the pre-requisites are achieved. Otherwise, the formal assessment cannot commence and thus no grading will be awarded.

Bonus Credit

These credits in NBv2.0 are counted under the corresponding categories and the maximum possible credits under each category is 100%. A factor of 1.2 is included for bonus calculation scoring.

IA Credit

These credits in NBv2.0 are counted towards the total number of credits qualifying for an award classification. A maximum 10 IA credits could be submitted for achieving higher score in the assessment.

Assessment

The assessment shall be undertaken by BAS appointed by BSL. The Applicant shall provide documentation and photographic evidence.

Determination of Overall Grade

The final certificate grading for projects certified under BEAM Plus New Buildings Version 2.0 (NB v2.0) is subject to the following conditions:

Grade	Minimum scoring for each Category	Total scoring
Platinum	To be announced later.	
Gold		
Silver		
Bronze		

PROJECT GENERAL INFORMATION

For the purposes of Provisional Assessment and Final Assessment, Applicants should submit a project description document including the following general project information:

- Total *site* area,
- Gross floor area (GFA)
- Construction floor area (CFA) breakdown
- Building type
- Number of floors
- Summary of green strategies
- Members of project team

Applicants should also provide the following supporting documents:

- General building plan (GBP)
- Full set of MEP drawings including HVAC system, plumbing and drainage system, electrical system and lift system.
- Master project programme
- Landscape *Master Plan*/ Landscape plan
- All relevant consents to commence works from the Buildings Department
- Lease Conditions/ Engineering Conditions

Applicants should submit a BEAM Plus v2.0 Credit Checklist.

BETA

	Section	Credit Requirement	Extent of Application	Credit
2	Integrative Design and Management (IDCM)			25 + 12 BONUS
IDCM P1	Sustainability Champions - Project	<p>Prerequisite achieved for demonstrating that an accredited BEAM Professional (BEAM Pro) with a valid credential for BEAM Plus New Buildings is engaged as the project BEAM Pro of the consultant team.</p> <p>The project BEAM Pro shall:</p> <ol style="list-style-type: none"> 1) Act as the point of contact with Hong Kong Green Building Council and BEAM Society Limited for administrative matters relating to BEAM Plus certification; 2) Participate as one of the key project team members in the design and construction stages, with assistance of Construction BEAM Plus defined under IDCM 6 if any, to oversee the submission materials are in the compliance with relevant requirements of the BEAM Plus Manual. The project BEAM Pro may also assume other roles in the consultant team of the project; 3) Create a BEAM Plus NB Certification Checklist including project goals, performance and BEAM Plus target; 4) Provide guidance to the project and construction teams regarding BEAM Plus principles, structure, timing, certification process and requirements of credits; and 5) Advise the Client on relevant professionals or parties on respective tasks to address relevant BEAM Plus certification requirements. 	All Buildings.	Required
IDCM P2	<i>Environmental Management Plan</i>	Prerequisite achieved for demonstrating that an <i>Environmental Management Plan</i> has been properly prepared.	All Buildings.	Required

	Section	Credit Requirement	Extent of Application	Credit
IDCM P3	Timber Used for Temporary Works	Prerequisite achieved for demonstrating that no virgin forest products are used for temporary works.	All Buildings.	Required
IDCM 1	Sustainability Champions - Design	<p>1 credit for at least two (2) members from at least two (2) applicable core design disciplines shall be accredited BEAM Professionals (BEAM Pro NB); for the Project achieves a Bronze rating or above.</p> <p>1 additional BONUS credit for at least one (1) additional member, from an applicable core design discipline different from the disciplines counted in the above credit, shall be an accredited BEAM Professional (BEAM Pro NB);</p> <p>alternatively, 1 additional BONUS credit for at least two (2) additional members, of an applicable core design discipline different from the disciplines counted in the above credit, shall be accredited BEAM Affiliates.</p>	All Buildings.	1 + 1 BONUS
IDCM 2	Complimentary Certification	<p>(a) BEAM Plus Neighbourhood (ND) 1 BONUS credit where the project is certified by BEAM Plus Neighbourhood certification.</p> <p>(b) BEAM Plus Interiors (BI) 1 BONUS credit for preparing the Project for BEAM Plus Interiors certification.</p> <p>(c) BEAM Plus Existing Buildings (EB) 1 BONUS credit for preparing the project for BEAM Plus Existing Buildings (EB) certification (comprehensive scheme).</p>	All buildings that are applicable for respective BEAM Plus certification tools.	3 BONUS
IDCM 3	Integrative Design Process	<p>(a) Early consideration of integrative building design process 1 credit for early consideration of the integrative design process regarding <i>whole-systems thinking</i> to explore the interrelationships among green building design strategies and systems in the conceptual design stage.</p> <p>1 additional credit for organizing at least one <i>multi-disciplinary design charrette</i> to formulate passive and active design strategies in the</p>	All Buildings.	4

Section	Credit Requirement	Extent of Application	Credit	
	conceptual/schematic design stages. (b) Early design consideration of buildability / constructability 1 credit for early design consideration of buildability to ease construction and save on-site materials/labour before completion of the design development stage. (c) Design consideration of operation and maintenance 1 credit for design consideration of the long-term operation and maintenance needs of the building and its engineering services.			
IDCM 4	Life Cycle Costing	1 credit for conducting life cycle costing for active systems.	All Buildings.	1
IDCM 5	Commissioning	4 credits for demonstrating the appointment of commissioning authority (CxA) before tender stage and provide a commissioning plan and commissioning reports.	All Buildings.	4
IDCM 6	Sustainability Champions - Construction	1 credit for at least two (2) accredited BEAM Professionals with valid credentials for BEAM Plus New Buildings are engaged by the main/lead contractor of the project; for the project achieves a Bronze rating or above. alternatively, 1 credit for at least one (1) accredited BEAM Professional and two (2) accredited BEAM Affiliates, with valid credentials for BEAM Plus New Buildings are engaged by the main/lead contractor of the project; for the project achieves a Bronze rating or above.	All Buildings.	1
IDCM 7	Measures to Reduce Site Emissions	(a) Minimization of air pollution 1 credit for providing adequate monitoring and mitigation measures to minimize air pollution during construction (demolition and foundation are included, if any). (b) Minimization of noise pollution 1 credit for providing adequate monitoring and mitigation measures to minimize noise pollution during construction (demolition and foundation are included, if any).	All Buildings.	4

Section	Credit Requirement	Extent of Application	Credit
	<p>(c) Minimization of water pollution 1 credit for providing adequate monitoring and mitigation measures to minimize water pollution during construction (demolition and foundation are included, if any).</p> <p>(d) Minimization of light pollution 1 credit for providing adequate mitigation measures to minimize light pollution during construction (demolition and foundation are included, if any).</p>		
IDCM 8	<p>Construction and <i>Demolition Waste Recycling</i></p> <p>(a) <i>Demolition waste recycling</i> 1 credit for demonstrating compliance with the Waste Management Plan and the application of proactive waste management provisions during demolition; and recycling at least 15% of <i>demolition waste</i>. 1 additional BONUS credit for demonstrating recycling of at least 30% of <i>demolition waste</i>. For exemplary performance, additional BONUS credit for demonstrating recycling of at least 60% of <i>demolition waste</i>.</p> <p>(b) <i>Construction waste recycling</i> 1 credit for demonstrating compliance with the Waste Management Plan and the application of proactive waste management provisions during construction (foundation to be included, if any); and recycling of at least 15% of <i>construction waste</i> (foundation waste to be included, if any). 1 additional BONUS credit for demonstrating recycling of at least 30% of <i>construction waste</i> (foundation waste to be included, if any). For exemplary performance, additional BONUS credit for demonstrating recycling of at least 60% of <i>demolition waste</i> (foundation waste to be included, if any).</p>	<p>All buildings requiring demolition which are under the Client's control for IDCM 8a. All buildings for IDCM 8b.</p>	2 + 4 BONUS
IDCM 9	<p>Construction IAQ Management</p> <p>1 credit for implementing a Construction IAQ Management Plan, undertaking a building 'flush</p>	<p>All areas for implementing a Construction IAQ Management Plan.</p>	1

	Section	Credit Requirement	Extent of Application	Credit
		out' or 'bake out', and replacement of all filters prior to occupancy.	All areas with central air-conditioning and ventilation systems for undertaking a building 'flush out' or bake out' and replacement of all filters prior to occupancy.	
IDCM 10	Considerate Construction	1 credit for demonstrating considerate measures to the neighbourhood, passers-by and workers. Good tree protection practices where tree preservation within the project <i>site</i> is required, should also be carried out.	All Buildings.	1
IDCM 11	Building Management Manuals	1 credit for providing a fully documented Operations and Maintenance Manual and Energy Management Manual.	All Buildings.	1
IDCM 12	Operator Training plus Chemical Storage and Mixing Room	1 credit for providing training for operations and maintenance staff to the minimum specified; and demonstrating that adequate maintenance facilities are provided for operations and maintenance work.	All Buildings.	1
IDCM 13	Digital Facility Management Interface	1 credit for providing a digital interface in addition to the project design metering provision for future facility management team to review the building operation performance.	All non-residential <i>building</i> and common areas of <i>residential buildings</i>	1
IDCM 14	Occupant Engagement Platform	1 BONUS for providing a digital platform to engage building occupants.	All non-residential <i>buildings</i>	1 BONUS
IDCM 15	Document Management System	(a) Project Team Document Management 1 credit for demonstrating the use of document management systems within the design team. (b) Facility Management Team Document Management 1 credit for demonstrating the use of document management systems to hand over to the facility management team.	All Buildings.	2

	Section	Credit Requirement	Extent of Application	Credit
IDCM 16	BIM Integration	<p>(a) Coordinated use of BIM within design teams 1 credit for the coordinated use of BIM amongst the design team.</p> <p>(b) Coordinated use of BIM within design and construction teams 1 BONUS for coordinated use of BIM amongst the design team and the contractors.</p> <p>(c) BIM for time 1 BONUS for using the BIM model for scheduling, cost and quantity, schedules preparation and tracking the project budget.</p> <p>(d) BIM for facility management use 1 BONUS for updating the BIM model to as-built condition.</p>	All Buildings.	1 + 3 BONUS
3	Sustainable Site (SS)			20 + 15 BONUS
SS P1	Minimum Landscaping Requirements	Prerequisite achieved for demonstrating compliance with minimum planting provisions in terms of viability and <i>site</i> coverage of greenery of at least 20% of the <i>site</i> .	All <i>sites</i> with a <i>site</i> area of 1,000 m ² or more.	Required
SS 1	Pedestrian-oriented and Low Carbon Transport	<p>(a) Accessibility to public transport 1 credit for achieving Accessibility Index of 15 or more for all buildings of a development.</p> <p>(b) Pedestrian-oriented access 1 credit for achieving 50% or more of the applicable pedestrian-oriented transport planning measures. 1 additional BONUS credit for achieving 100% of the applicable pedestrian-oriented transport planning measures.</p> <p>(c) Cycling facilities and network integration 1 BONUS credit for providing cycling facilities within the <i>Site</i> and integrating with the public cycling network if a public cycling network exists or has been planned nearby.</p> <p>(d) Charging facilities for Electric Vehicle (EV) 1 BONUS credit for providing EV charging facilities for at least half of the carparking spaces (including visitor car parks).</p>	All Buildings.	2 + 3 BONUS

	Section	Credit Requirement	Extent of Application	Credit
SS 2	Neighbourhood Amenities	<p>(a) Amenities for building users 1 credit where adequate amenities for building users are located within the <i>site</i> or 500m walking distance/ an equivalent horizontal commuting time from the <i>site</i> entrance(s).</p> <p>(b) Shared amenities for neighbourhood 1 credit where adequate shared amenities for the neighbourhood are provided within the <i>site</i> and are made available for public use.</p>	All Buildings.	2
SS 3	Building Design for Sustainable Urbanism	<p>(a) Sustainable urban design 1 credit for preparing a <i>site</i> design appraisal report demonstrating a proactive approach to achieve a people-oriented and place-making approach for sustainable <i>site</i> planning, and at least 30% of applicable sustainable urbanism measures are achieved. 2 credits for achieving at least 60% of applicable sustainable urbanism measures. 1 additional BONUS credit for achieving at least 90% of applicable sustainable urbanism measures.</p> <p>(b) Conservation of <i>cultural heritage</i> 1 BONUS credit for demonstrating that a proper heritage impact assessment mechanism and its recommendations have been implemented.</p>	All Buildings.	2 + 2 BONUS
SS 4	Neighbourhood Daylight Access	1 credit for designs for which the access to daylight of neighbouring sensitive buildings is maintained to the prescribed levels.	All Buildings.	1
SS 5	Noise Control for Building Equipment	1 credit for demonstrating that the level of the intruding noise at the facade of potential noise sensitive receivers is in compliance with the criteria recommended in the Technical Memorandum for the Assessment of Noise from Places Other than Domestic Premises, Public Places or Construction <i>Sites</i> .	All Buildings.	1

	Section	Credit Requirement	Extent of Application	Credit
SS 6	Light Pollution Control	<p>(a) Control of obtrusive artificial light 1 credit for demonstrating that obtrusive light from exterior lighting meets the specified performance for the environmental zone in which the building development is located.</p> <p>(b) Control of external light reflection from building 1 credit for demonstrating that sunlight reflection from external surfaces of the buildings is controlled by using materials with acceptable external light reflectance.</p>	All Buildings.	2
SS 7	Ecological Preservation/ Enhancement	<p>(a) Preservation and / or enhancement of ecological impact 1 credit for demonstrating that ecological values of the <i>Site</i> are preserved where existing habitat types of medium or high ecological values are identified on the <i>Site</i>.</p> <p>alternatively, 1 credit for demonstrating that ecological values of the <i>Site</i> are enhanced where existing habitat types of medium ecological values are identified on the <i>Site</i>.</p> <p>alternatively, 1 credit for demonstrating that ecological values of all identified existing habitat types on the <i>Site</i> are low and habitat types of medium ecological values are introduced on the <i>Site</i>. 1 additional BONUS credit for demonstrating that ecological values of all identified existing habitat types on the <i>Site</i> are low and habitat types of high ecological values are introduced on the <i>Site</i>.</p> <p>(b) Interconnectivity with adjacent areas of ecological value 1 BONUS credit for providing physical interconnectivity between any existing/ new areas of ecological value within the <i>Site</i> and any adjacent areas of medium or high ecological value. The total combined total area of eligible interconnected areas represents not less than 5% of the total <i>Site</i> Area.</p> <p>(c) Tree retention</p>	All buildings except <i>brownfield</i> sites or sites on reclaimed land for SS 7a. Sites with adjacent areas of medium or high ecological value for SS 7b. Sites with existing trees preserved for SS 7c.	1+ 4 BONUS

Section	Credit Requirement	Extent of Application	Credit
	<p>1 BONUS credit for demonstrating that existing trees are retained in situ such that the combined <i>girth</i> of the retained trees, with individual <i>girth</i> of at least 150mm, is at least 20% of the total <i>girth</i> of all existing trees on <i>site</i>.</p> <p>For exemplary performance, ADDITIONAL BONUS credit where 40% or more of the total <i>girth</i> of all existing trees are retained on <i>site</i>.</p>		
SS 8	<p>Urban Heat Island Mitigation</p> <p><u>For Site area <1000m²</u> (a) Urban Design Guidelines Chapter 11 1 credit for implementing at least 2 <i>site</i> level strategies under Section 11 of Hong Kong Planning Standards and Guidelines Chapter 11 Urban Design Guidelines.</p> <p><u>For Site area ≥ 1000m²</u> (a) Sustainable Building Design Measures 1 credit for providing shade on at least 5% of the <i>site</i> area and at least 50% of non-roof impervious surfaces on the <i>site</i> (parking, walkways, plazas) using light coloured high-<i>albedo</i> materials (<i>albedo</i> of at least 0.4). 1 credit for demonstrating compliance with prescribed requirements of the SBD Guidelines as promulgated in the PNAP APP-152. 1 additional BONUS credit for demonstrating compliance with prescribed requirements and relevant prescriptive requirements of the SBD Guidelines as promulgated in the PNAP APP-152 with enhanced performances.</p> <p>(b) Tree Coverage 1 BONUS credit for demonstrating that at least 10% of the total <i>Site</i> Area is provided with tree coverage. For exemplary performance, ADDITIONAL BONUS credit where 20% or more of the <i>site</i> is provided with tree coverage.</p> <p>(c) <i>Air Ventilation Assessment (AVA)</i> For conducting an AVA by <i>wind tunnel</i> or <i>Computer Fluid Dynamics (CFD)</i> according to the prevailing AVA methodology introduced by the Government demonstrating that</p>	All Buildings.	<p>For <i>Site</i> area < 1000m²: 1 For <i>Site</i> area ≥ 1000m²: 4 + 4 BONUS</p>

Section	Credit Requirement	Extent of Application	Credit
	<p>better or equivalent ventilation performances than a baseline case: 1 Credit for demonstrating annual wind condition. 1 Credit for demonstrating summer wind condition.</p> <p>(d) Intra Urban Heat Island Study 1 BONUS credit for conducting an Intra Urban Heat Island Study demonstrating that a maximum <i>Intra-Urban Heat Index</i> (difference between T_{urban} and T_{met}) in summer is less than 0.8 °C.</p>		
SS 9	Immediate Neighbourhood Wind Environment	1 credit for demonstrating that no pedestrian areas will be subject to excessive wind velocities caused by amplification due to the <i>site</i> layout design and/or building design.	All Buildings. 1
SS 10	Outdoor Thermal Comfort	<p>(a) Shaded or covered routes 1 credit is awarded where at least one shaded or covered route, connects the <i>site</i> with nearby amenities/<i>site</i> main entrance/transport hub.</p> <p>(b) Passive open spaces with thermal comfort 1 credit is awarded where 50% or more of the passive open spaces and pedestrian zones achieve thermal comfort. This is demonstrated on a typical summer day at 3:00 pm in Hong Kong.</p>	All <i>sites</i> with <i>site</i> area of 1,000 m ² or more. 2
SS 11	Stormwater Management	1 credit for demonstrating that adequate stormwater management design measures have been provided to manage the total volume of runoff corresponding to a design rainfall of at least 30mm/day for the <i>site</i> in its post-developed conditions. 1 additional BONUS credit for demonstrating that adequate stormwater management measures have been provided to manage the total volume of runoff corresponding to a design rainfall of at least 40mm/day for the <i>site</i> in its post-developed conditions.	All <i>sites</i> with <i>site</i> area of 1,000 m ² or more. 1 + 1 BONUS
SS 12	Design for Climate Change Adaptation	1 BONUS for studying the projected variation in temperature and rainfall and water level rise/storm surge of adjacent water bodies due to climate change and its impact on the development, and prepare	All Buildings. 1 BONUS

Section	Credit Requirement	Extent of Application	Credit
	mitigation proposal to improve the climate resilience of the building.		
4	Materials and Waste (MW)		14 + 21 BONUS
MW P1	Minimum Waste Handling Facilities	Prerequisite achieved for meeting minimum provisions of waste recycle facilities for the collection, sorting, storage, recycling (recovered material) and disposal (waste).	All buildings except one single family domestic building with not more than 3 floors, or domestic part of a composite building for one single family with not more than 3 floors, or a building not normally occupied or for transient stay (e.g. pump house, sewage treatment plant, carpark building). Required
MW 1	Building Re-use	<p><u>Compliance method 1</u> 1 BONUS credit for the <i>reuse</i> of 20% or more (by mass or volume) of existing structures (<i>sub-structure</i> and <i>superstructure</i>). 2 BONUS credits for the <i>reuse</i> of 40% or more (by mass or volume) of existing structures (<i>sub-structure</i> and <i>superstructure</i>). For exemplary performance, additional BONUS credit for the <i>reuse</i> of 90% or more (by mass or volume) of existing structures (<i>sub-structure</i> and <i>superstructure</i>).</p> <p>alternatively, <u>Compliance method 2</u> 1 BONUS credit for the <i>reuse</i> of 25% or more (by surface area) of <i>superstructure</i> elements (including at least floor, roof decking) & enclosure materials (including at least skin, framing). 2 BONUS credits for the <i>reuse</i> of 50% or more (by surface area) of <i>superstructure</i> elements (including at least floor, roof decking) & enclosure materials (including at least skin, framing). For exemplary performance, additional BONUS credit for the <i>reuse</i> of 90% or more (by surface area) of <i>superstructure</i> elements (including at least floor, roof decking) & enclosure materials (including at least skin, framing).</p>	All Buildings. 3 BONUS

	Section	Credit Requirement	Extent of Application	Credit
MW 2	Modular and Standardised Design	<p>1 credit for designing modular elements which contributed at least 50% (by mass, volume, dollar value or surface area) of the major elements and modules in the project.</p> <p>For exemplary performance, additional BONUS credit for designing modular elements which contributed 90% or more (by mass, volume, dollar value or surface area) of the major elements and modules in the project.</p>	All buildings except for a single one-storey building with total floor areas not exceeding 230m ²	1 +1 BONUS
MW 3	Prefabrication	<p>(a) Structural elements 1 credit when the manufacture of 10% of prefabricated structural elements has been off-site. 1 additional BONUS credit where the manufacture of 20% of prefabricated structural elements has been off-site.</p> <p>alternatively, (b) Façade elements 1 credit when the manufacture of 10% of prefabricated facade elements has been off-site. 1 additional BONUS credit where the manufacture of 20% of prefabricated facade elements has been off-site.</p> <p>alternatively, (c) Architectural/ internal building elements 1 credit when the manufacture of 10% of prefabricated architectural/ internal building elements has been off-site. 1 additional BONUS credit where the manufacture of 20% of prefabricated architectural/ internal building elements has been off-site. 1 additional BONUS credit for compliance with requirements listed in sub-item (a), (b) and (c). For exemplary performance, additional BONUS credit where the manufacture of 50% or more of prefabricated elements in sub-item (a) or (b) or (c) has been off-site.</p>	All Buildings.	1+3 BONUS

	Section	Credit Requirement	Extent of Application	Credit
MW 4	Design for Durability and Resilience	<p>(a) Building material selection appraisal 1 credit for appraisal report demonstrating a proactive approach to evaluate the durability of building materials, and at least 3 of relevant listed items.</p> <p>(b) Protecting vulnerable parts of the building from damage 1 BONUS credit for provide suitable protection measures, or designed features or solutions to prevent damage to vulnerable parts.</p> <p>(c) Protecting exposed parts of the building from material degradation 1 BONUS credit for incorporate appropriate design and specification measures to limit material degradation due to environmental factors.</p>	All Buildings.	1+2 BONUS
MW 5	Sustainable Forest Products	<p>1 credit for demonstrating at least 30% for residential development and 50% for non-residential development of all timber and composite timber products used in the project are from sustainable sources/ recycled timber.</p> <p>For exemplary performance, additional BONUS for demonstrating 90% or more of all timber and composite timber products used in the project are from sustainable sources/ recycled timber.</p>	All Buildings.	1+1 BONUS
MW 6	Recycled Materials	<p>(a) Outside surface works and structures 1 credit where at least 10% of all materials used for <i>site</i> exterior surface works, structures and features with recycled content.</p> <p>alternatively, (b) Building façade and structural components 1 credit where at least 10% of all materials used for facade and structural components are materials with recycled content; OR the use of <i>Pulverised Fuel Ash (PFA)</i> as a partial cement replacement in concrete that the PFA content is not less than 25%; OR the use of <i>Ground Granulated Blast furnace Slag (GGBS)</i> as a partial cement replacement in concrete that</p>	All Buildings.	1+2 BONUS

Section	Credit Requirement	Extent of Application	Credit
	<p>the GGBS content is not less than 40%.</p> <p>alternatively, (c) Interior non-structural components 1 credit where at least 10% of all materials used for interior non-structural components are materials with recycled content. 1 additional BONUS credit for compliance with requirements listed in sub-item (a), (b) and (c). For exemplary performance, additional BONUS credit where 50% or more of all materials used for sub-item (a) or (b) or (c) are materials with recycled content.</p>		
MW 7	<p>Ozone Depleting Substances</p> <p>(a) Refrigerants 1 credit for the use of refrigerants with a value less than or equal to the threshold of the combined contribution to ozone depletion and <i>global warming potentials</i> using the specified equation.</p> <p>(b) Ozone depleting materials 1 credit for the use of products in the building fabric and services that avoid using ozone depleting substances in their manufacture, composition or use.</p>	All Buildings.	2
MW 8	<p><i>Regional Materials</i></p> <p>1 credit for the use of <i>regional materials</i> meeting prescribed requirement, which contribute at least 10% of all building materials used in the project. 1 additional BONUS credits for the use of <i>regional materials</i> meeting prescribed requirement, which contribute at least 20% of all building materials used in the project. For exemplary performance, additional BONUS credit for the use of <i>regional materials</i> meeting prescribed requirement, which contribute 50% or above of all building materials used in the project.</p>	All Buildings.	1+2 BONUS
MW 9	<p>Use of Green Products</p> <p>(a) Certified green products 1 credit for having at least 5% certified green products in one (1) of the listed categories (outside surface works, building façade and structures, interior non-structural components, and building services components).</p>	All Buildings.	2+4 BONUS

Section	Credit Requirement	Extent of Application	Credit	
	<p>2 credit for having at least 5% certified green products in two (2) of the listed categories (outside surface works, building façade and structures, interior non-structural components, and building services components).</p> <p>1 additional BONUS credit for having at least 5% of certified green products under Construction Industry Council (CIC) Carbon Labelling Scheme/ HKGBC Green Product Accreditation and Standards (HK G-PASS) in one (1) of the listed categories (outside surface works, building façade and structures, interior non-structural components, and building services components).</p> <p>For exemplary performance, additional BONUS credit for having at least 25% of certified green products under CIC Carbon Labelling Scheme/ HK G-PASS in one (1) of the listed categories (outside surface works, building façade and structures, interior non-structural components, and building services components).</p> <p>(b) <i>Rapidly renewable materials</i> 1 BONUS credit for demonstrating 5% of all building materials/ products of interior non-structural components in the project is <i>rapidly renewable materials</i>.</p> <p>For exemplary performance, additional BONUS credit for demonstrating 25% of all building materials/ products of interior non-structural components in the project is <i>rapidly renewable materials</i>.</p>			
MW 10	Life Cycle Assessment	1 credit for demonstrating the <i>embodied energy</i> in the major elements of the building structure of the building has been studied and optimised through a Life Cycle Assessment (LCA).	All Buildings.	1

	Section	Credit Requirement	Extent of Application	Credit
MW 11	Adaptability and Deconstruction	<p>(a) Spatial adaptability 1 credit for designs providing spatial flexibility that can adapt spaces for different uses, and allows for expansion to permit additional spatial requirements to be accommodated.</p> <p>alternatively, (b) Flexible engineering services 1 credit for flexible design of services that can adapt to changes of layout and use.</p> <p>alternatively, (c) Structural adaptability 1 credit for designs providing flexibility through the use of building structural systems that allow for change in future use, and which is coordinated with interior planning modules. 1 additional BONUS credit for compliance with requirements listed in sub-item (a), (b) and (c).</p>	All Buildings.	1 + 1 BONUS
MW 12	Enhanced Waste Handling Facilities	<p>(a) Additional recyclables collection 1 credit for provision of facilities for collection, sorting, storage and disposal of 2 other recyclable streams.</p> <p>(b) Additional recycling facilities provision 1 credit for additional of facilities for collection, sorting, storage and disposal of recyclables.</p> <p>(c) Waste treatment equipment 1 BONUS for providing at least one set of waste treatment equipment.</p> <p>(d) Alternatives to recycling facilities 1 BONUS for provide alternative means of waste collection systems.</p>	All buildings except one single family domestic building with not more than 3 floors, or domestic part of a composite building for one single family with not more than 3 floors, or a building not normally occupied or for transient stay (e.g. pump house, sewage treatment plant, carpark building).	2 + 2 BONUS
5	Energy Use (EU)			31 + 8 BONUS
EU P1	Minimum Energy Performance	<p>Demonstrate performance improvement against the latest edition of Building Energy Code (BEC).</p> <p><u>For BEC Governing Building Types:</u> Refer to the latest edition of BEC to demonstrate that performance improvement is achieved in both of the following building services</p>	All Buildings.	Required

Section	Credit Requirement	Extent of Application	Credit
	<p>systems provided by the project owner: Improve 2% of code specified minimum coefficient of performance (COP) for Air-conditioning equipment unit; and Reduce 3% of code specified maximum allowable lighting power density for lighting installation. <u>For Non-BEC Governing Building Types:</u> All Non-BEC governing building types and spaces are required to demonstrate their compliance with the latest BEC on: Air-conditioning equipment efficiency (full load COP); and Lighting power density for listed space type in the code <u>For building consist of BEC and non-BEC Governing Building or Space type:</u> All requirements of compliance listed in this credit are required.</p>		
EU 1	<p>Low Carbon Passive Design</p> <p>Passive designs that can reduce building HVAC load, facilitate natural ventilation and maximise daylight will be rewarded in this credit under either prescriptive path or performance path.</p> <p>Option 1: Prescriptive Path 3 Credits for incorporating any 4 of the passive design strategies listed below:</p> <ol style="list-style-type: none"> 1) Optimum Spatial Planning 2) External overhang (fix/movable) 3) Vegetated building envelope 4) Cross Ventilation Provision 5) Daylighting Provision <p>Option 2: Performance Path <u>HVAC Load Reduction</u></p> <ol style="list-style-type: none"> 1) Built Form and <i>orientation</i> 1 credit for reducing building envelope load from a hypothetical case with at least 22.5° difference in <i>orientation</i> with justification by simulation. 2) Optimum spatial planning 1 credit for demonstrating consideration of optimum spatial planning to enhance energy conservation with justification by simulation. 3) <i>External shading</i> devices 	All Buildings.	6

Section	Credit Requirement	Extent of Application	Credit
	<p>1 credit for the provision of fixed or movable <i>external shading</i> devices, in the form of vertical or horizontal sun shading feature with justification by simulation.</p> <p>4) Vegetated building envelope 1 credit for the provision of vegetated building envelope with justification by calculation. <u>Natural Ventilation</u></p> <p>5) Space layout for natural ventilation 1 credit for demonstrating that space layout is designed to facilitate the utilisation of natural ventilation with justification by simulation. <u>Daylight</u></p> <p>6) Space layout for daylight penetration 1 credit for demonstrating that the space is well-lit by daylight and reduce occupants' dependency on artificial lighting with justification by simulation method.</p>		
EU 2	<p>Reduction of CO₂ Emissions</p> <p>Select one of the 2 compliance route option described below.</p> <p>Option 1 – Performance Path (1-10 Credits + 5 Bonus) Demonstrate a percentage of reduction on annual CO₂ emission of the proposed building performance compared with the baseline performance. 1 to 10 credits for annual CO₂ emission reduction from 3% to 21%. Additional 1 to 5 BONUS for annual CO₂ emission reduction from 23% to 31%.</p> <p>Option 2 – Prescriptive Path (1-7 Credits) Demonstrate a prescriptive compliance in below listed item. <i>Residential buildings</i> and <i>non-residential buildings</i> should follow different path. For building consist of both residential and non-residential parts, demonstrate the compliance for all requirements as listed below. (a) Passive Building Design Enhancement (0.5 to 3 credits) <ul style="list-style-type: none"> • Building Envelope • Natural Ventilation (b) Active Building Design Improvement (1 to 4 credits)</p>	All Buildings.	10 + 5 BONUS

	Section	Credit Requirement	Extent of Application	Credit
		<ul style="list-style-type: none"> • Each air-conditioning equipment • Lighting System • Lift and escalator installation (N/A for building with No Lift & Escalators) • 		
EU 3	Peak Electricity Demand Reduction	<p>Based on EU2 Path 1 – Performance Path 1 to 3 credits for reducing the peak electricity demand by the following saving percentages from 5% to 15%.</p> <p>Base on EU 2 Path 2 – Prescriptive Path Achieve 4 credit points in EU2 (prescriptive path) could achieve 1 credit in EU3.</p>	All Buildings	3
EU 4	Metering and Monitoring	<p>(a) Fundamental metering and monitoring 1 credit for providing energy sub-metering system for equipment and systems in spaces. 1 BONUS for providing performance auditing sub-metering system for equipment and systems in spaces.</p> <p>(b) Metering for tenanted area 1 BONUS for providing metering that allows monitoring of tenants' electricity consumption.</p>	All Non-residential buildings and common area of residential buildings	1 + 2 BONUS
EU 5	Renewable And Alternative Energy Systems	<p>(a) Solar energy feasibility study 1 credit for evaluating the building roof's potential in harnessing solar energy.</p> <p>(b) On-site renewable energy application 1 to 5 credits for using on-site renewable energy systems to offset annual building energy consumption for controlled area to offset 0.5% to 2.5% energy consumption.</p>	All Buildings.	6
EU 6	Air-Conditioning Units	<p>(a) Compliance with manufacturer's recommendation. 1 credit for complying with manufacturer's recommended installation positions for optimal heat rejection.</p> <p>(b) Performance verification</p>	All buildings using window or split-type air conditioners.	2

Section	Credit Requirement	Extent of Application	Credit
	1 credit for demonstrating the operating temperatures of all window type, split-type or packaged type air-conditioning units do not exceed manufacturer's recommendation for the specified COP in the manufacturer's technical specifications via computational simulation techniques.		
EU 7	Clothes Drying Facilities	(a) Provision of clothes drying facilities 1 credit for providing permanent clothes drying facilities provision for all residential units under suitable location conditions. (b) Demonstration of effectiveness 1 BONUS for demonstrating the effectiveness of permanent clothes drying facilities via computational analysis.	Residential buildings 1 + 1 BONUS
EU 8	Energy Efficient Appliances	1 credit when 60% of total rated power of appliances are certified energy efficient products. 1 additional credit when 80% of total rated power of appliances are certified energy efficient products.	Residential buildings and hotel 2
6	Water Use (WU)		12 + 3 BONUS
WU P1	Minimum Water Saving Performance	Demonstrate that the use of water efficient flow devices leads to an estimated annual saving of 10%.	All Buildings. Required
WU 1	Annual Water Use	(a) Further potable water saving 1 to 3 credits for demonstrating that the use of water efficient flow devices leads to an estimated annual saving from 20% to 30%. (b) Exemplary potable water saving. 1 BONUS for demonstrating that the use of water efficient flow devices leads to an estimated annual saving of 40%.	All Buildings. 3 + 1 BONUS
WU 2	Water Efficient Irrigation	1 to 2 credits for reducing potable water consumption for irrigation from 25% to 50%. 1 additional BONUS for reducing potable water consumption for irrigation by 100% in comparison with the baseline.	All Buildings with permanent greenery and permanent irrigation system. 2 + 1 BONUS
WU 3	Water Efficient Appliances	1 credit for installing water efficient appliances that achieve Grade 1	Residential Buildings. 1

	Section	Credit Requirement	Extent of Application	Credit
		under the WSD's Water Efficiency Labelling Scheme.		
WU 4	Water Leakage Detection	1 credit for installing water leakage detection systems in all municipal potable water tank rooms.	All Buildings.	1
WU 5	Twin Tank System	1 credit for providing twin tank for potable water supply system and flushing water supply system.	All Buildings.	1
WU 6	Cooling Tower Water	1 credit for achieving 7 or more cycles of concentration with acceptable water quality.	All buildings equipped with cooling tower using potable water as makeup water.	1
WU 7	Effluent Discharge to Foul Sewers	1 credit for demonstrating a reduction in annual sewage volumes by 20% or more.	All Buildings.	1
WU 8	Water Harvesting and Recycling	(a) Harvested rainwater 1 credit for harvesting of rainwater that achieve a reduction of 5% or more in the consumption of potable water. (b) Recycled grey water 1 credit for recycled grey water that achieve a reduction of 5% or more in the consumption of potable water. (c) Exemplary water recycling 1 BONUS credit where harvested rainwater, recycled grey water or a combination of both leads to a reduction of 10% or more in the consumption of potable water.	All Buildings.	2 + 1 BONUS
7	Health and Wellbeing (HWB)			21 + 9 BONUS
HWB P1	Minimum Ventilation Performance	(a) Measure outdoor air pollutants on-site prior to building design to understand the <i>site</i> conditions. (b) Demonstrate the project is in compliance with the minimum ventilation quantity with respect to its designed ventilation mode.	All Buildings.	Required
HWB 1	Healthy and Active Living	1 BONUS credit for scoring at least 75% of all applicable design measures for healthy and active living.	Indoor / semi-outdoor communal areas of building development.	1 BONUS

	Section	Credit Requirement	Extent of Application	Credit
HWB 2	<i>Biophilic Design</i>	<p>1 BONUS credit for demonstrating visual connection with nature and/ or <i>biophilic design</i> features at an assessment space with Visual Quality Score of 2 or above.</p> <p>1 additional BONUS credit for demonstrating visual connection with nature and/ or <i>biophilic design</i> features at an assessment space with Visual Quality Score of 3 or above.</p>	All Buildings	2 BONUS
HWB 3	Inclusive Design	<p>(a) Universal Accessibility 1 credit for providing at least ten (10) applicable enhanced provisions as stipulated in the “Recommended Design Requirements” of BFA 2008.</p> <p>(b) Weather protection and family friendly features 1 BONUS credit for providing prescribed weather protection and at least two (2) family friendly facilities features.</p>	All Buildings.	1 + 1 BONUS
HWB 4	Enhanced Ventilation	<p>(a) Fresh air provision</p> <p>1) Fresh air provision in <i>normally occupied spaces</i> 1 credit for demonstrating that all <i>normally occupied spaces</i> in the building are provided with increased ventilation.</p> <p>2) Fresh air provision in <i>not normally occupied spaces</i> 1 credit for demonstrating that all <i>not normally occupied spaces</i> in the building are provided with adequate ventilation.</p> <p>3) On-site measurements 1 BONUS credit for conducting on-site measurements to verify the ventilation performance for all <i>normally occupied spaces</i>.</p> <p>(b) Exhaust air 1 credit for the provision of an effective ventilation system for spaces where significant indoor pollution sources are generated.</p>	All Buildings.	3 + 1 BONUS
HWB 5	Waste Odour Control	1 credit for installing odour sensor at all discharge points from enclosed waste disposal and recycling spaces.	All Buildings.	1

	Section	Credit Requirement	Extent of Application	Credit
HWB 6	Acoustics and Noise	<p>(a) Room Acoustics</p> <p>1) 1 credit for demonstrating that mid-frequency reverberation time in applicable spaces of landlord's controlled area meets the prescribed criteria of different types of premises.</p> <p>2) 1 credit for demonstrating that mid-frequency reverberation time in applicable rooms of tenanted area meets the prescribed criteria of different types of premises.</p> <p>(b) Noise Isolation</p> <p>1) 1 credit for demonstrating airborne noise isolation between spaces fulfils the prescribed criteria.</p> <p>2) 1 BONUS for demonstrating impact noise isolation between floors fulfills the prescribed criteria.</p> <p>(c) Background Noise</p> <p>1 credit for demonstrating background noise levels from both external sources and building services equipment are within the prescribed criteria.</p>	<p>All buildings for parts (a) (1), (b) (1) and (c)</p> <p>All buildings with tenanted spaces for parts (a) (2)</p> <p><i>Residential buildings</i> for part (b) (2)</p>	4 + 1 BONUS
HWB 7	Indoor Vibration	1 credit for demonstrating vibration levels not exceeding the prescribed criteria.	All Buildings.	1

	Section	Credit Requirement	Extent of Application	Credit
HWB 8	Indoor Air Quality	<p>(a) Indoor air quality in occupied spaces</p> <p>1.1 Path 1 1 credit for demonstrating compliance with the prescribed limits for Carbon monoxide (CO), Nitrogen dioxide (NO₂), Ozone (O₃) in the sampled occupied spaces. 1 credit for demonstrating compliance with the prescribed limits for Carbon dioxide (CO₂), Total volatile organic compounds (VOCs), Formaldehyde (HCHO) and Radon (Rn) in the sampled occupied spaces. 1 credit for demonstrating compliance with the prescribed limits for Airborne bacteria in the sampled occupied spaces.</p> <p>1.2 Path 2 3 credits for submitting a valid IAQ Certification Scheme (Good Class) certificate issued by the Environmental Protection Department (EPD) covering the whole building.</p> <p>1.3 Path 3 3 credits and 1 BONUS credit for submitting a valid IAQ Certification Scheme (Excellent Class) certificate issued by the Environmental Protection Department (EPD) covering the whole building.</p> <p>(b) Air quality in car park 1 credit for demonstrating compliance with the pollutant concentration limits specified in ProPECC PN 2/96.</p> <p>(c) Mould prevention and control 1 BONUS for adopting mould prevention and control strategies.</p>	<p>All buildings for parts (a) and (c) All buildings with enclosed and/or semi-enclosed car park of areas more than 10% of Construction Floor Area for part (b).</p>	4 + 2 BONUS
HWB 9	Thermal Comfort	<p>(a) Thermal Comfort Analysis 2 credits for conducting thermal comfort analysis and demonstrate that <i>normally occupied spaces</i> can fulfil the thermal comfort requirements.</p> <p>(b) Thermal Comfort Measurement 1 BONUS credit for conducting on-site measurements to verify the thermal comfort performance.</p>	All Buildings.	2 + 1 BONUS

	Section	Credit Requirement	Extent of Application	Credit
HWB 10	Artificial Lighting	(a) Artificial lighting in <i>normally occupied spaces</i> 1 credit for achieving the prescribed lighting performance in <i>normally occupied spaces</i> . (b) Artificial lighting in not <i>normally occupied spaces</i> and <i>unoccupied spaces</i> 1 credit for achieving the prescribed lighting performance in not <i>normally occupied spaces</i> and <i>unoccupied spaces</i> .	All Buildings.	2
HWB 11	Daylight	2 credits for demonstrating at least 55% of the total area of the studied <i>normally occupied spaces</i> achieves spatial Daylight Autonomy _{300/50%} (sDA _{300/50%}) and no more than 10% of the same area receives Annual Sunlight Exposure _{100,250} (ASE _{100,250}).	Residential, office and education buildings.	2
HWB 12	Biological Contamination	1 credit for complying with the recommendations given in the Code of Practice for Prevention of Legionnaires' Disease 2016 Edition in respect of Water Supply Systems, HVAC Systems and other Water Features.	All Buildings.	1
8	Innovations and Additions (IA)			Maximum 10 BONUS
IA 1	Innovations and Additions	Present evidence of the application of new practices, technologies and techniques and the associated benefits in addressing sustainability objectives for new buildings.	All buildings, for innovations that have not been addressed in respective categories of the NB certification tool.	Maximum 10 BONUS for IA1

2	Integrative Design and Construction Management	2.P Prerequisite 2.1 Integrative Design Process 2.2 Green Construction Practices 2.3 Smart Design and Technologies
	Introduction	<p>This section focuses on integration design management which maximises opportunities for integrated and cost-effective green design approaches and construction methodologies; improvement on user's health and wellbeing; smart technologies and innovative approaches for green design and construction.</p>
2.P	Prerequisite	IDCM P1 Sustainability Champions – Project IDCM P2 Environmental Management Plan IDCM P3 Timber Used for Temporary Works
	Background	<p>This part sets out the minimum requirements for integrative design management in terms of engaging the Project BEAM Pro to facilitate the certification, non-virgin timber used for temporary works, Environmental Management Plan and Waste Management Plan during construction.</p>
2.1	Integrative Design Process	IDCM 1 Sustainability Champions - Design IDCM 2 Complimentary Certification IDCM 3 Integrative Design Process IDCM 4 Life Cycle Costing IDCM 5 Commissioning
	Background	<p>An integrative process is a comprehensive approach to building systems and equipment design. With guidance of Project BEAM Professionals, the project team looks for synergies among systems and components, the mutual advantages that can help achieve high levels of building performance human comfort, and environmental benefits. The process should involve rigorous questioning and coordination and challenge typical project assumptions. Team members collaborate to enhance the efficiency and effectiveness of every system.</p>
2.2	Green Construction Practices	IDCM 6 Sustainability Champions - Construction IDCM 7 Measures to Reduce <i>Site</i> Emissions IDCM 8 Construction and Demolition Waste Recycling IDCM 9 Construction IAQ Management IDCM 10 Considerate Construction IDCM 11 Building Management Manuals IDCM 12 Operator Training plus Chemical Storage and Mixing Room
	Background	<p>Construction <i>site</i> activities can be a source of significant environmental degradation, unless appropriate steps are taken to reduce the emissions to air, land and water, and to reduce annoyance from construction related noise. It is the responsibility of contractors to do all in their power to employ appropriate construction methods that reduce air, noise, water and light pollution.</p>
2.3	Smart Design and Technologies	IDCM 13 Digital Facility Management Interface IDCM 14 Occupant Engagement Platform IDCM 15 Document Management System IDCM 16 BIM Integration
	Background	<p>To encourage the use of automation, data and behavioural science to enable building professionals to boost and maintain energy efficiency by optimising equipment and related processes for energy performance and comfort requirements.</p>

2 Integrative Design and Construction Management **2.P Prerequisite**

IDCM P1 Sustainability Champions - Project

Extent of Application	All buildings.
Objective	Facilitate the application for the BEAM Plus certification process and to ensure the compliance of relevant requirements of the BEAM Plus Manual.
Credits Attainable	Prerequisite
Credit Requirement	<p>Prerequisite achieved for demonstrating that an accredited BEAM Professional (BEAM Pro) with a valid credential for BEAM Plus New Buildings is engaged as the project BEAM Pro of the consultant team.</p> <p>The project BEAM Pro shall:</p> <ol style="list-style-type: none"> 1) Act as the point of contact with Hong Kong Green Building Council and BEAM Society Limited for administrative matters relating to BEAM Plus certification; 2) Participate as one of the key project team members in the design and construction stages, with assistance of Construction BEAM Plus defined under IDCM 6 if any, to oversee the submission materials are in the compliance with relevant requirements of the BEAM Plus Manual. The project BEAM Pro may also assume other roles in the consultant team of the project; 3) Create a BEAM Plus NB Certification Checklist including project goals, performance and BEAM Plus target; 4) Provide guidance to the project and construction teams regarding BEAM Plus principles, structure, timing, certification process and requirements of credits; and 5) Advise the Client on relevant professionals or parties on respective tasks to address relevant BEAM Plus certification requirements.
Assessment	<ol style="list-style-type: none"> 1) Complete the prescribed form with qualification details, appointment information and confirmation of appointment of the project BEAM Pro. The appointed project BEAM Pro should maintain his/her accreditation and credentials from his/her appointment to completion of the certification process. 2) Provide a BEAM Plus NB Certification Checklist that at minimum to: <ol style="list-style-type: none"> 2.1 Determine the BEAM Plus certification level to pursue (certified, Bronze, Silver, Gold, or Platinum); 2.2 Select the BEAM Plus credits to meet the targeted certification level; and 2.3 Identify the responsible parties to ensure the BEAM Plus requirements for each prerequisite and selected credits are met. Changes in the Checklist should be recorded with justification and submitted in FA stage. 3) Provide the following signed and dated meeting minutes (confidential/ sensitive project matters not required by the credits shall be excluded) showing the participation of the Project BEAM Pro in: <ol style="list-style-type: none"> 3.1 Introductory workshop/meeting providing guidance to the project team regarding BEAM Plus principles, structure, timing and certification processes; 3.2 Kick-off meeting with Construction BEAM Pro (and Affiliates, if any) as defined under IDCM 6, if any, and main building contractors, highlighting key BEAM Plus requirements during the construction stage; and 3.3 At least one review meeting providing guidance on BEAM Plus requirements to the contractors during construction.

(a) Additional Information

Hong Kong Green Building Council publishes the latest registers of BEAM Professionals and BEAM Affiliates on its website. [ONLINE] Available at: <https://www.hkgbc.org.hk/eng/beam-Professional.aspx>. [Accessed 7 July 2017]

(b) Related Credits

IDCM 1 Sustainability Champions - Design

The related credit encourages the engagement of Design BEAM Pro(s) and/or Affiliates engaged by respective core design disciplines to integrate BEAM standards and practices into the planning, design and construction of the building.

IDCM 3 Integrative Design Process

The related credit encourages early consideration of integrative building design process, buildability and operational issues to support holistic and cost-effective outcomes of building performance, human health and environmental benefits.

IDCM 6 Sustainability Champions – Construction

The related credit encourages the engagement of BEAM Pros and/or Affiliates engaged by contractors during construction to work collaboratively with the project BEAM Pro to monitor progress against targeted construction-related BEAM Plus requirements..

2 Integrative Design and Construction Management **2.P Prerequisite**

IDCM P2 Environmental Management Plan

Extent of Application	All buildings.
Objective	Encourage a high standard of environmental management during construction.
Credits Attainable	Prerequisite
Credit Requirement	Prerequisite achieved for demonstrating that an Environmental Management Plan has been properly prepared.

- Assessment**
- 1) An *Environmental Management Plan (EMP)* shall be prepared to address potential significant environmental aspects and impacts, to propose appropriate mitigation measures, to include environmental monitoring and auditing plans and to propose a waste management system. Reference shall be made to:
 - 1.1. Environmental, Transport and Works Bureau (ETWB)'s Technical Circular (Works) 19/2005, Appendix C [1];
 - 1.2. Hong Kong Construction Association (HKCA)'s Best Practice Guide for Environmental Protection on Construction Sites, Section 3.2.3 [2];
 - 1.3. Environmental Protection Department (EPD)'s Environmental Monitoring and Audit - Guidelines for Development Projects in Hong Kong, Appendix D2 [3]
 - 2) For a project that is subject to EPD's scrutiny, environmental measurement points agreed by EPD shall be adopted. For a project that is not subject to EPD's scrutiny, environmental measurement points are recommended to be agreed with BEAM Society Limited (BSL)/BEAM Assessor (BAS) by Credit Interpretation Request at the beginning of the project assessment.
 - 3) Provide EMP(s) of construction (demolition and foundation to be included, if any) prepared by contractors and reviewed/endorsed by Construction BEAM Pro (or Construction BEAM Affiliate) defined under IDCM 6 or Project BEAM Pro defined under IDCM P1.
 - 4) Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring that the contractors prepare EMP(s), if construction (demolition and foundation to be included, if any) has not yet commenced at PA stage.

IDCM 7 Measures to Reduce Site Emissions

The related credit addresses on measures to minimise air, noise, water and light pollution during construction of buildings and the infrastructure serving buildings.

IDCM 8 *Construction and Demolition Waste Recycling*

The related credit encourages best practices in management of construction resources consumption, including waste reduction.

2 Integrative Design and Construction Management

2.P Prerequisite

IDCM P3 Timber Used for Temporary Works

Extent of Application	All buildings.
Objective	Encourage the well-managed use of timber.
Credits Attainable	Prerequisite
Credit Requirement	Prerequisite achieved for demonstrating that no virgin forest products are used for temporary works.
Assessment	<ol style="list-style-type: none"> 1) Timber used for all temporary works (falsework, formworks and hoarding works) shall originate from sustainable forestry or re-used existing material, unless exceptional circumstances occur. 2) Sustainable timber shall be certified by the Forest Stewardship Council (FSC) [1], the American Forest and Paper Association (AFPA) [2] or “known licensed sources” [3]. 3) Monthly summary tables which demonstrates prerequisite requirement shall be prepared and declared by contractor for project quantity surveyor’s review. 4) Provide a confirmation letter by project quantity surveyor to confirm that no virgin forest products are used for temporary works. Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause precluding use of virgin timber in all temporary works, if construction (demolition and foundation to be included, if any) has not yet commenced at PA stage.

2 Integrative Design and Construction Management **2.1 Integrative Design Process**

IDCM 1 Sustainability Champions - Design

Extent of Application	All buildings.
Objective	Encourage the engagement of BEAM Professionals and/or Affiliates to integrate BEAM Plus standards and practices into the planning and design of the building.
Credits Attainable	1 + 1 BONUS
Credit Requirement	<p>1 credit for at least two (2) members from at least two (2) applicable core design disciplines shall be accredited BEAM Professionals (BEAM Pro NB); for the Project achieves a Bronze rating or above.</p> <p>1 additional BONUS credit for at least one (1) additional member, from an applicable core design discipline different from the disciplines counted in the above credit, shall be an accredited BEAM Professional (BEAM Pro NB); or alternatively, at least two (2) additional members, of an applicable core design discipline different from the disciplines counted in the above credit, shall be accredited BEAM Affiliates.</p>
Assessment	<p>The Design BEAM Pro(s) and BEAM Affiliates shall:</p> <ol style="list-style-type: none">1. Be engaged by applicable core design disciplines from project inception to completion of detailed design and specifications stage of the Project. Core design disciplines shall be justified by the specific nature of the Project. The following disciplines, if they are engaged in the Project, shall form the core design disciplines<ol style="list-style-type: none">1.1. Project management;1.2. Facility management;1.3. Architectural;1.4. Structural/ civil engineering;1.5. Building services engineering;1.6. Surveying;1.7. Landscaping;1.8. Sustainability;1.9. Environmental;1.10. Interior designer; and1.11. Other as proposed and justified by the specific nature of the Project etc. <p>The Design BEAM Pro(s) and BEAM Affiliates may also assume other roles in the consultant team of the Project.</p> <ol style="list-style-type: none">2. Participate in introductory workshop/ meeting as required under IDCM P1.3. Participate in <i>multi-disciplinary design charrette</i> as required under IDCM 3, if applicable.<ol style="list-style-type: none">3.1. Complete the prescribed form with qualification details, appointment information and confirmation of appointment of the Design BEAM Affiliates if any, and BEAM Pro(s).

The appointed Design BEAM Affiliates, if any, and BEAM Pro(s) should maintain his/her accreditation and credential during his/her appointment.

- 3.2. Provide the following signed and dated meeting minutes (confidential / sensitive project matters are not required by the credits and shall be excluded) showing the participation of the Design BEAM Pro in an introductory workshop/meeting as required under IDCM P1 and a *multi-disciplinary design charrette* as required under IDCM 3 (if applicable).

(b) Related credits

IDCM P1 Sustainability Champions - Project

The related prerequisite encourages the engagement of BEAM Pro to facilitate the application for the BEAM Plus certification process and to ensure the compliance of relevant requirements of the BEAM Plus.

IDCM 3 Integrative Design Process

The related credit encourages early considerations for integrative building design process, buildability and operational issues to support holistic and cost-effective outcomes of building performance, human health and environmental benefits.

IDCM 6 Sustainability Champions – Construction

The related credit encourages the engagement of BEAM Pro(s) and / or Affiliates engaged by contractors during construction to work collaboratively with the Project BEAM Professional to monitor progress against targeted construction-related BEAM Plus requirements.

2 Integrative Design and Construction Management **2.1 Integrative Design Process**

IDCM 2 Complimentary Certification

Extent of Application All buildings that are applicable for respective BEAM Plus certification tools

Objective Encourage pursuing green building practices from planning, building design, construction, interior fitting-out to operation.

Credits Attainable 3 BONUS

Credit Requirement **(a) BEAM Plus Neighbourhood (ND)**
1 BONUS credit where the project is certified by BEAM Plus Neighbourhood certification.

(b) BEAM Plus Interiors (BI)
1 BONUS credit for preparing the Project for BEAM Plus Interiors certification.

(c) BEAM Plus Existing Buildings (EB)
1 BONUS credit for preparing the project for BEAM Plus Existing Buildings (EB) certification (comprehensive scheme).

Assessment **(a) BEAM Plus Neighbourhood (ND)**
Provide a copy of valid BEAM Plus Neighbourhood Certificate at the time of the first submission for Provisional Assessment of the BEAM Plus New Building (NB) certification.
Provide evidence demonstrating that *site* planning is aligned with and is essentially the same as the *Master Plan* defined in the ND certification.

(b) BEAM Plus Interiors (BI)
Provide justification on the extent of eligible non-domestic premises of the project. Definition of eligible premises shall be reference to section 1.2.1 of BEAM Plus Interiors Manual v1.0 [1].
Provide a report demonstrating prerequisite compliance for at least 50% of total UFA of all eligible premises in BEAM Plus BI certification.
Confirmation letter by the Client in attaining the BONUS Credit(s) is accepted as an alternative to the above-mentioned evidence for Provisional Assessment.

(c) BEAM Plus Existing Buildings (EB)
Provide a declaration letter by the Applicant/Owner/Developer regarding their commitment to pursue BEAM Plus EB certification (comprehensive scheme).

Provide a feasibility study on BEAM Plus EB certification of the project detailing:

- 1) Checklist for potential credits and rating;
- 2) Budget estimation for EB certification; and
- 3) *Roll-out plan*.

Confirmation letter by the Client in attaining the Bonus Credit(s) is accepted as alternative to above mentioned evidence for Provisional Assessment.

None

2 Integrative Design and Construction Management **2.1 Integrative Design Process**

IDCM 3 Integrative Design Process

Extent of Application	All buildings.
Objective	Encourage early consideration of the integrative building design process, buildability and operational issues to support holistic and cost-effective outcomes of building performance, human health and environmental benefits.
Credits Attainable	4
Credit Requirement	<p>(a) Early considerations for integrative building design process 1 credit for early consideration of the integrative design process regarding <i>whole-systems thinking</i> to explore the interrelationships among green building design strategies and systems in the conceptual design stage.</p> <p>1 additional credit for organizing at least one <i>multi-disciplinary design charrette</i> to formulate passive and active design strategies in the conceptual/schematic design stages.</p> <p>(b) Early design consideration of buildability/ constructability 1 credit for early design consideration of buildability to ease construction and save on-site materials/labour before completion of the design development stage.</p> <p>(c) Design consideration for operation and maintenance 1 credit for design consideration of the long-term operation and maintenance needs of the building and its engineering services.</p>
Assessment	<p>(a) Early considerations for integrative building design</p> <p>1.1 <u>Exploration of interrelationships among green building design strategies and systems</u> Provide a design appraisal in comparing preliminary sustainable design benefits for at least one (1) baseline and two (2) design options in the conceptual design stage. A baseline, with same development potential as the design options, is a design that conforms to statutory requirements such as Building Ordinance and Town Planning Ordinance.</p>

A design option is designed with different strategies to address at least two (2) issues of each of the following considerations:

Considerations	Issues
Site planning and outdoor environmental quality	<ul style="list-style-type: none"> - Building permeability/air ventilation/thermal comfort; - Landscaping/site coverage with greenery; - Neighbourhood daylight access; - Ecological value; - Climate resilience.
Built form/orientation and energy use/generation	<ul style="list-style-type: none"> - Cooling load reduction; - Lighting load reduction; - Natural ventilation potential;

	- Renewable energy opportunities.
Building envelope attributes ¹ and energy use	- Cooling load reduction/OTTV/RTTV estimation; - Lighting load reduction; - Natural ventilation potential.
Note: 1. Building envelope attributes refer to: - insulation values; - window-to-wall ratios; - glazing characteristics; - shading; - window operability.	

The sustainable design benefits for respective considerations shall be demonstrated by either:

- 1) prescriptive methodologies (e.g. spreadsheet calculation) accepted by BEAM Plus, or
- 2) “Simple box” environmental/ energy modelling (simplified massing model that may not include detail systems)

1.2 Multi-disciplinary design charrette

Provide evidence that at least one *multi-disciplinary design charrette* has been held before the completion of schematic design stage.

The *charrette* shall, at minimum, address the following issues:

1.2.1 Participants:

- a) Developer/ owner representative;
- b) User representative (if users are known in design stage);
- c) Operation and maintenance team representative (if identified in schematic design stage);
- d) Members from core design disciplines as defined in IDCM 1;

1.2.2 Introduce fundamentals of integrative design process [1]:

- a) Well-defined vision, goals and objectives;
- b) Collaborative team and open communication;
- c) Whole-system thinking and innovative synthesis, and
- d) Iterative process and feedback cycles;

1.2.3 Review and agree on following principal design strategies:

- a) Key stakeholders’ values, aspirations and requirements;
- b) *Functional programming*;
- c) *Site* planning and outdoor environmental quality
- d) Built form and *orientation*;
- e) Building envelope attributes;
- f) Key active building systems for energy saving/ generation;
- g) Other strategies to be proposed by the Applicant.

(b) Early design consideration of buildability/ constructability

1. Demonstrate early consideration of buildability to ease construction and save on-site materials/labour before the completion of the design development stage, either by:
 - 1.1. engaging a construction management consultant;
 - 1.2. design optimisation of voids and complex form; or
 - 1.3. adopting at least 75% of design measures on the 3S concept

1 BC Green Building Roundtable. Roadmap for the Integrated Design Process. [ONLINE] Available at: <http://www.greenspacencr.org/events/IDPRoadmap.pdf>. [Accessed 11 July 2017].

(standardisation, simplification and single integrated element) as promulgated in the Development Bureau's Guidelines [2].

2. For (1), provide evidence demonstrating that recommendations/inputs by the construction management consultant/contractor have been reviewed/adopted. This shall include the following:
 - 2.1. Appointment letter of the construction management consultant or the contractors;
 - 2.2. Correspondence or meeting minutes (confidential/sensitive project matters not required by the credit and shall be excluded) demonstrating that the design has been reviewed and recommendations have been suggested; and
 - 2.3. The recommendations have been adopted.
3. For (2), provide evidence demonstrating that design of high voids and complex forms, if any, have been optimised:
 - 3.1. Percentage of high voids (total height of voids over 9m, measured by the clear heights between building structure) to total building height is below 15%, and
 - 3.2. Complexity of tower built form in terms of tilting, tapering, twisting or free form has been optimised to fulfil both requirements:

Height of building	Maximum offset of the building measuring against the ground floor plate or any typical floor plate	Maximum percentage of total number of floors with offsets measured against the total number of floors of the building
< 45m	4m	35%
45m < 90m	3m	25%
90m < 135m	2m	15%
≥ 135m	1m	5%

4. For (3), provide report with completed prescribed form and dated photographic evidences to demonstrate implementation of at least 75% of listed 3S concept measures.
 - 4.1. Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring the contractors to carry out 3S concept measures, if construction (demolition and foundation to be included, if any) not yet commence at PA stage.

(c) Design consideration for operation and maintenance

1. Provide evidence that the design has considered the long-term operation and maintenance needs for the building and its engineering services by providing at least any 5 of the following features:
 - 1.1. Building Management System (BMS);
 - 1.2. Davit arm/ gondola system;
 - 1.3. External pipe duct or pipe duct in communal areas;
 - 1.4. Fall arrest system;
 - 1.5. Maintenance platform for building services installations;
 - 1.6. Maintenance workshop for facility management;
 - 1.7. Movable working platform for maintenance;
 - 1.8. Access and safety provision for external air-conditioning at height without use of scaffolding;
 - 1.9. Others to be proposed by the Applicant.

(b) Related Credits

IDCM 4 Life Cycle Costing

The related credit encourages the use of life cycle costing to facilitate an investigation of potential design options, specifications, operation and maintenance

SS P1 Minimum Landscape Requirements

The related prerequisite credit encourages building development to preserve or expand urban greenery.

SS 4 Neighbourhood Daylight Access

The related credit encourages building development which is sensitive to

the needs of neighbours in terms of preserving daylight and views.

SS 7 Ecological Preservation/ Enhancement

The related credit encourages strategies to preserve and/or enhance the ecological value of the *site* in terms of habitat and biodiversity.

SS 8 Urban Heat Island Mitigation

The related credit encourages higher overall *site* coverage of greenery and stipulates minimum *site* coverage of greenery in the *Primary Zone* (the 15m vertical zone of a *site* along the abutting street level).

SS 9 Immediate Neighbourhood Wind Environment

The credit encourages improvement in wind environments around and adjacent to buildings have been adequately considered regarding wind amplification, and where appropriate, suitable mitigation measures are provided.

SS 10 Outdoor Thermal Comfort

The related credit considers the positive effect of shading by trees and the surrounding ground surface temperatures of greenery within the *site*.

EU 1 Low Carbon Passive Design

The related credit encourages passive building design allowing buildings to respond to the local climate; reducing the reliance on active servicing for human comfort.

EU 5 Renewable and Alternative Energy Systems

The related credit encourages the wider application of renewable energy sources in buildings.

2 Integrative Design and Construction Management **2.1 Integrative Design Process**

IDCM 4 Life Cycle Costing

Extent of Application	All buildings
Objective	Encourage the use of life cycle costing to facilitate investigation of potential design options, specifications, operation and maintenance.
Credits Attainable	1
Credit Requirement	1 credit for conducting life cycle costing for active systems.
Assessment	<p>Conduct life cycle costing for 3 design options for the each of the below active systems, if present:</p> <ol style="list-style-type: none">1) Hot water system;2) Interior lighting system; and3) Air conditioning system. <p>The life cycle costing exercise can be non-discounted and should include the following costs:</p> <ol style="list-style-type: none">1) Acquisition;2) Operation (utilities); and3) Maintenance (replacements, planned maintenance and management costs). <p>While developing design options, the applicant should consider different configurations and specifications, for example, initial costs, number of equipment units involved, equipment efficiency and lifespan, etc.</p> <p>Indicate cost of each design options of active system over 20, 30, 40 and 50 years and highlight which design option will have the lowest life cycle cost at the 50th year.</p> <p>Prepare a life cycle costing report including all the assumptions made and the results of life cycle costing.</p> <p>Substantiate the costs with catalogues, suppliers' recommendations, quotes or invoices. Cost approximations suggested by Quantitative Surveyor or Contractors are also accepted. No professional life cycle costing software is required for this study.</p> <p>Note that the costing exercise imposes no obligation for implementation but encourages consideration of the costs of systems throughout their life cycle.</p>

2 Integrative Design and Construction Management **2.2 Integrative Design Process**

IDCM 5 Commissioning

Extent of Application	All buildings
Objective	Ensure the building systems perform as design specified and buildings operate as design intended.
Credits Attainable	4
Credit Requirement	4 credits for demonstrating the appointment of commissioning authority (CxA) before tender stage and provide a commissioning plan and commissioning reports.
Assessment	<p>(a) Engage commissioning authority (CxA)</p> <ol style="list-style-type: none"> 1. Identify a Chartered Engineer, Registered Professional Engineer, MHKIE, Registered Professional Surveyor or MHKIS, ASHRAE BCxP as the CxA. 2. The CxA should have the proper experience and credentials including adequate expertise in the commissioning of electrical and mechanical systems, equipment and components to develop and implement effective commissioning. 3. The CxA should have direct experience with at least two similar projects and must have been involved before the start of schematic design stage to countercheck the systems will meet the design intents. 4. The CxA must not be responsible for any aspect of the project design or construction management or supervision for the subject building. 5. The CxA must not be an employee of the design firm. 6. The CxA must not be an employee of, or contracted through, a contractor or construction manager dealing with construction contracts. For design and build projects, the owner should directly employ the CxA. 7. The CxA may be a qualified employee or consultant of the owner. 8. Reporting of all conditions and findings must be immediate and directly from the CxA to the Client. The CxA shall be responsible for: <ol style="list-style-type: none"> 8.1. Reviewing and approval of commissioning specifications; 8.2. The development of a commissioning plan; 8.3. Facilitate and ultimately oversee the commissioning process for all systems to be commissioned; and 8.4. Document whether systems, equipment and components are functioning in accordance with the design intent and in accordance with the construction documents. <p>(b) Develop commissioning plan</p> <ol style="list-style-type: none"> 1. Establish a preliminary commissioning plan for the CxA to outline the scope of commissioning and systems to be tested. 2. Project roles and responsibilities, the commissioning team's project directory, and schedule of commissioning activities should all be included in the commissioning plan. 3. The Commissioning plan is a living document that is updated throughout the life of the project and will become the basis for the final commissioning report. 4. The Commissioning plan should include the following content: <ol style="list-style-type: none"> 4.1. Goals and objectives; 4.2. General project information; 4.3. Systems to be commissioned;

- 4.4. Description of the Commissioning team, including team members, roles and responsibility;
- 4.5. Description of the Commissioning team's communication protocol, coordination, meetings and management;
- 4.6. Development of system functional test procedures for HVAC&R systems and associated controls, light and daylighting controls, domestic hot water systems, lift and escalator systems and renewable energy systems;
- 4.7. Verification of system performance;
- 4.8. Reporting deficiencies and the resolution process; and
- 4.9. Acceptance of the building systems.

(c) Commissioning Report

1. Before construction begins, develop commissioning requirements based on the systems included in the design and incorporate them into the construction documents.
2. Commissioning specifications inform the contractors and/or sub-contractors of their roles and responsibilities throughout the commissioning process.
3. After all commissioning tasks except seasonally deferred commissioning have been completed, the commissioning report(s) with all the approved checklists and endorsement from CxA shall be provided.
4. The Commissioning report should include the following content:
 - 4.1. Executive summary of commissioning process and results, system deficiencies identified and resolutions, outstanding issues identified.
 - 4.2. List of participants and their respective roles;
 - 4.3. Brief building description;
 - 4.4. Commissioning process scope;
 - 4.5. Design review log;
 - 4.6. Installation verification checklist;
 - 4.7. List of systems commissioned;
 - 4.8. Equipment documentation;
 - 4.9. Functional performance tests including date and time of test, individuals present during testing, visual inspection observations, sensor checks, device checks, operating mode tests and results;
 - 4.10. List of outstanding commissioning issues and any testing that is scheduled for a later date; and
 - 4.11. All outstanding deficiencies identified during or as a result of commissioning activities should be listed and highlighted.

2 Integrative Design and Construction Management

2.2 Green Construction Practices

IDCM 6 Sustainability Champions - Construction

Extent of Application	All buildings.
Objective	Encourage the engagement of BEAM Professionals and/or Affiliates by contractors during construction to work collaboratively with the project BEAM Professional to monitor progress against targeted construction-related BEAM Plus requirements.
Credits Attainable	1
Credit Requirement	1 credit for at least two (2) accredited BEAM Professionals with valid credentials for BEAM Plus New Buildings are engaged by the main/lead contractor of the project; for the project achieves a Bronze rating or above. Alternatively, 1 credit for at least one (1) accredited BEAM Professional and two (2) accredited BEAM Affiliates, with valid credentials for BEAM Plus New Buildings are engaged by the main/lead contractor of the project; for the project achieves a Bronze rating or above.
Assessment	<ol style="list-style-type: none"> 1. The Construction BEAM Pro(s) and BEAM Affiliates shall: <ol style="list-style-type: none"> 1.1. Be engaged by main/lead contractor of <i>superstructure</i> from commencement of the respective contract (i.e. if the contract covers foundation and <i>superstructure</i>, a Construction BEAM Pro shall be engaged during foundation) to completion of the certification process. 1.2. Work collaboratively with the project BEAM Pro to monitor progress against targeted construction-related BEAM Plus requirements as defined in the BEAM Plus NB certification checklist. 1.3. Participate in the kick-off meeting and at least 1 review meeting as required under IDCM P1. 1.4. Provide routine check and ensure the construction-related submission materials are in the compliance with relevant requirements of the BEAM Plus Manual. The Construction BEAM Pro(s) and BEAM Affiliates may also assume other roles in the construction team of the project. 2. Complete prescribed form with qualification details, appointment information and confirmation of the appointment of the Construction BEAM Affiliates, if any, and the BEAM Pro(s). The appointed Construction BEAM Affiliates, if any, and BEAM Pro(s) should maintain his/her accreditation and credentials during his/her appointment. Provide copies of relevant contract documents highlighting the clause requiring the main/lead constructor to engage related Construction BEAM Pro(s) and BEAM Affiliates, if main contract has not yet commence at PA stage. 3. Provide signed and dated meeting minutes (confidential/sensitive project matters not required by the credits shall be excluded) showing the participation of the Construction BEAM Pros (and Design Affiliates, if any) in the kick-off meeting and at least one review meeting as required under IDCM P1.

(b) Related Credits

IDCM P1 Sustainability Champions - Project

The related prerequisite encourage the engagement of BEAM Professionals to facilitate the application for the BEAM Plus certification process and to ensure the compliance of relevant requirements of the BEAM Plus.

IDCM 1 Sustainability Champions - Design

The related credit encourages the engagement of BEAM Pros and/or Affiliates engaged by respective core design disciplines to integrate BEAM Plus standards and practices into the planning, design and construction of the building.

2 Integrative Design and Construction Management

2.2 Green Construction Practices

IDCM 7 Measures to Reduce Site Emissions

Extent of Application All buildings.

Objective Minimise pollution (air, noise, water discharge and light) during the demolition, if any, construction of buildings and the infrastructure serving buildings.

Credits Attainable 4

Credit Requirement

(a) Minimization of air pollution

1 credit for providing adequate monitoring and mitigation measures to minimize air pollution during construction (demolition and foundation are included, if any).

(b) Minimization of noise pollution

1 credit for providing adequate monitoring and mitigation measures to minimize noise pollution during construction (demolition and foundation are included, if any).

(c) Minimization of water pollution

1 credit for providing adequate monitoring and mitigation measures to minimize water pollution during construction (demolition and foundation are included, if any).

(d) Minimization of light pollution

1 credit for providing adequate mitigation measures to minimize light pollution during construction (demolition and foundation are included, if any).

Note:

- 1) Partial credit shall be awarded for individual construction stages (i.e. demolition, foundation and *superstructure* in a default ratio of 1:1:3). The Applicant may submit justification and propose an alternative ratio based on the relative pollution control extent and resource demand in various construction stages. For a project that covers all 3 stages, the partial credit attainable for demolition, foundation and *superstructure* are 0.2, 0.2 and 0.6 respectively. Similarly, for a project where demolition is not required or not under the Client's control, the partial credit attainable for foundation and *superstructure* are 0.25 and 0.75 respectively.
- 2) All applicable stages must be attempted to attain any partial credit.

Assessment

(a) Minimization of air pollution

1. Proactive dust control provisions shall be in reference to Good Housekeeping Checklist in Appendix 4.1 of Hong Kong Construction Association's Best Practice Guide for Environmental Protection on Construction *Sites* [1]. Checklist of dust control provisions is provided in prescribed form.
2. Provide baseline monitoring measurements as prescribed in IDCM P2. Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring the contractors to provide baseline monitoring measurements if construction has not yet commence at the PA stage.
3. Provide monthly environmental management report(s) that demonstrate at minimum:
 - 3.1. Implementation of monitoring and mitigation measures to minimise air pollution as defined in *Environmental Management Plan (EMP)* under IDCM P2;
 - 3.2. There is no conviction or complaints about air emissions from *site*, that has been upheld by the Environmental Protection Department or police leading to the issue of a fine or prosecution;
 - 3.3. Implementation of proactive dust control provisions with dated photo evidence and completed prescribed forms; and
 - 3.4. Total Suspended Particulates (TSP) levels are satisfactory. For project compliance with EPD's Environmental Monitoring and Audit is NOT required. Requirement on 24-hour TSP levels are NOT required.

The report(s) shall be reviewed and endorsed by the Construction BEAM Pro (or BEAM Affiliate) as defined under IDCM 6 or the project BEAM Pro as defined under IDCM P1.

4. Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring the contractors to provide monthly environmental management report(s) if construction (demolition and foundation to be included, if any) not yet commenced at PA stage.

(b) Minimization of noise pollution

1. Proactive noise control provisions shall be reference to section 6.9 of Hong Kong Construction Association's Best Practice Guide for Environmental Protection on Construction *Sites*. Checklist of noise control provisions are provided in prescribed forms.
2. Provide baseline monitoring measurements as prescribed in IDCM P2. Provide extracts of tender documents, contract conditions and/ or specifications highlighting the clause requiring the contractors to provide baseline monitoring measures if construction has not yet

1 Hong Kong Construction Association – Best Practice Guide for Environmental Protection on Construction Sites. [ONLINE] Available at: http://www.hkca.com.hk/uploads/eversioin_docs/e33f38c5128a824b4f7cb18b7b5ab751.pdf. [Accessed 11 July 2017].

commenced at PA stage

3. Provide monthly environmental management report(s) that demonstrate at minimum:
 - 3.1. Implementation of monitoring and mitigation measures to minimize noise pollution as defined in *Environmental Management Plan (EMP)* under IDCM P2;
 - 3.2. There is no conviction or complaints about noise emissions from *site*, that has been upheld by the Environmental Protection Department or Police leading to the issue of a fine or prosecution;
 - 3.3. Implementation of proactive noise control provisions with dated photo evidence and completed prescribed form; and
 - 3.4. Noise levels are satisfactory.

The report(s) shall be reviewed and endorsed by the Construction BEAM Pro (or BEAM Affiliate) as defined under IDCM 6 or the project BEAM Pro as defined under IDCM P1.

4. Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring the contractors to provide monthly environmental management report(s) if construction (demolition and foundation to be included, if any) not yet commenced at PA stage.

(c) Minimization of water pollution

1. Proactive wastewater management provisions shall be reference to Environmental Protection Department's Practice Note for Professional Persons on Construction *Site* Drainage [2]. Checklist of wastewater management provisions is provided in the prescribed forms.
2. Provide baseline monitoring measurements as prescribed in IDCM P2.
Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring the contractors to provide baseline monitoring measurements if construction has not yet commenced at the PA stage
3. Provide monthly environmental management report(s) that demonstrate at minimum:
 - 3.1. Implementation of monitoring and mitigation measures to minimize water pollution as defined in *Environmental Management Plan (EMP)* under IDCM P2;
 - 3.2. There is no conviction or complaints about water pollution from *site*, that has been upheld by the Environmental Protection Department or Police leading to the issue of a fine or prosecution;

2 Environmental Protection Department – Practice Note for Professional Persons ProPECC PN 1/94. Construction *Site* Drainage. [ONLINE] Available at: http://www.epd.gov.hk/epd/sites/default/files/epd/english/resources_pub/publications/files/pn94_1.pdf. [Accessed 11 July 2017].

- 3.3. Implementation of proactive waste water control provisions with dated photo evidence and completed prescribed form; and
- 3.4. Wastewater discharge qualities are satisfactory.

The report(s) shall be reviewed and endorsed by the Construction BEAM Pro (or BEAM Affiliate) as defined under IDCM 6 or the project BEAM Pro as defined under IDCM P1.

- 4. Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring the contractors to provide monthly environmental management report(s) if construction (demolition and foundation to be included, if any) not yet commenced at PA stage.

(d) Minimization of light pollution

- 1. Provide evidence demonstrating that external light control measures have been implemented during construction (demolition and foundation are included, if any). External light control measures shall include at minimum:
 - 1.1. Operating hours for light
 - 1.1.1. Switch off external lighting (essential light and feature light not included) when not needed or after operating hours.
 - 1.1.2. Switch off feature lighting (e.g. hoarding lighting) after 11p.m.
 - 1.1.3. Maintain only essential light (e.g. lighting for safety and security) at the acceptable level as required.
 - 1.2. Automatic controls for lighting
 - 1.2.1. Incorporate automatic control (e.g. timer switch) to switch off the external lighting when not needed or after operating hours.
 - 1.3. Lighting nuisance control measures
 - 1.3.1. Position and aim the lighting at hoarding properly to avoid overspill of light to outside the area being lit up.
 - 1.3.2. For lighting up vertical structures (e.g. signs & hoarding), direct the beam to the structures and avoid overspill of light.
 - 1.3.3. Using lighting/ provide with appropriate shields, baffles, louvers and cut-off features to prevent light overspill to nearby residence and into the sky, and glare from the light source.
 - 1.4. Prevention of glare to road users
 - 1.4.1. Ensure the external lighting along site boundary is appropriately positioned, aimed or shielded so that illumination of nearby roads will not be adversely affected.
- 2. Provide extracts of tender documents, contract conditions and/ or specifications highlighting the clause requiring the contractors to provide monthly environmental management report(s) if construction

(demolition and foundation to be included, if any) not yet commence at PA stage.

IDCM 8 Construction and Demolition Waste Recycling

Extent of Application	All buildings requiring demolition which are under the Client's control for IDCM 8a. All buildings for IDCM 8b.
Objective	Encourage best practices in the management of construction resource consumption, including waste reduction.
Credits Attainable	2 + 4 BONUS
Credit Requirement	<p>(a) Demolition waste recycling</p> <p>1 credit for demonstrating compliance with the Waste Management Plan and the application of proactive waste management provisions during demolition; and recycling at least 15% of <i>demolition waste</i>.</p> <p>1 additional BONUS credit for demonstrating recycling of at least 30% of <i>demolition waste</i>.</p> <p>For exemplary performance, additional BONUS credit for demonstrating recycling of at least 60% of <i>demolition waste</i>.</p> <p>(b) Construction waste recycling</p> <p>1 credit for demonstrating compliance with the Waste Management Plan and the application of proactive waste management provisions during construction (foundation to be included, if any); and recycling of at least 15% of <i>construction waste</i> (foundation waste to be included, if any).</p> <p>1 additional BONUS credit for demonstrating recycling of at least 30% of <i>construction waste</i> (foundation waste to be included, if any).</p> <p>For exemplary performance, additional BONUS credit for demonstrating recycling of at least 60% of <i>demolition waste</i> (foundation waste to be included, if any).</p>
Assessment	Proactive waste management provisions shall reference the Good Housekeeping Checklist in Appendix 8.2 of Hong Kong Construction Association's Best Practice Guide for Environmental Protection on Construction Sites [1]. Checklist of waste management provisions is provided in the prescribed form.

1 Hong Kong Construction Association – Best Practice Guide for Environmental Protection on Construction Sites. [ONLINE] Available at: http://www.hkca.com.hk/uploads/eversioin_docs/e33f38c5128a824b4f7cb18b7b5ab751.pdf. [Accessed 11 July 2017].

(a) Demolition waste recycling

1. Provide a Construction and Demolition Material Management Plan (C&DMMP). Reference shall be made to Environmental, Transport and Works Bureau (ETWB)'s Technical Circular (Works) 209/32/105 [2].
2. Provide monthly waste management report(s) that demonstrate implementation of, at a minimum:
 - 2.1. The Waste Management Plan (WMP) as defined in *Environmental Management Plan (EMP)* under IDCM P2; and
 - 2.2. Proactive waste management provisions with dated photo evidence and completed prescribed form.
3. Provide monthly waste and recycling reports that include, at a minimum:
 - 3.1. Waste flow tables (see prescribed form);
 - 3.2. All waste and recycling records; and
 - 3.3. Collection organization/recycler information.
4. Provide a summary of the percentage of *demolition waste* recycled (either by weight or by volume) prepared and declared by contractor, and reviewed and endorsed by the project quantity surveyor. *Demolition waste* (including broken concrete and excavated materials) that is diverted from Government public fill reception facilities and *reused/recycled* in other projects/facilities shall be included.
5. Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring the contractors carry out waste management measures and recycling of *demolition waste*.

(b) Construction waste recycling

1. Provide a Construction and Demolition Material Management Plan (C&DMMP). Reference shall be made to Environmental, Transport and Works Bureau (ETWB)'s Technical Circular (Works) 209/32/105 [2].
2. Provide monthly waste management report(s) that demonstrate implementation of, at a minimum:
 - 2.1. The Waste Management Plan (WMP) as defined in *Environmental Management Plan (EMP)* under IDCM P2; and
 - 2.2. Proactive waste management provisions with dated photo evidence and completed prescribed form.

Monthly waste management report(s) shall be prepared from the commencement of construction (foundation to be included, if any) to the completion of all construction activities if demolition has not yet commenced at PA stage.

2 Environmental, Transport and Works Bureau (ETWB) – Technical Circular (Works) 209/32/105. [ONLINE] Available at: <http://www.devb.gov.hk/fileManager/technicalcirculars/en/upload/125/1/c-2002-33-0-1.pdf>. [Accessed 11 July 2017].

3. Provide monthly waste and recycling reports that include, at a minimum:
 - 3.1. Waste flow table (see prescribed form);
 - 3.2. All waste and recycling records; and
 - 3.3. Collection organization/recycler information.
4. Provide a summary of the percentage of *demolition waste* recycled (either by weight or by volume) prepared and declared by contractor, and reviewed and endorsed by the project quantity surveyor. *Construction waste* (including broken concrete and excavated materials) that is diverted from Government public fill reception facilities and *reused/recycled* in other projects/facilities shall be included.
5. Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring the contractors to carry out waste management measures and recycling of *construction waste* (foundation waste is to be included, if any) if construction (foundation is to be included, if any) has not yet commence at PA stage.

IDCM 9 Construction IAQ Management

Extent of Application	All areas for implementing a Construction IAQ Management Plan. All areas with central air-conditioning and ventilation systems for undertaking a building 'flush out' or 'bake out' and replacement of all filters prior to occupancy.
Objective	Ensure that ventilation systems are not contaminated from construction activities.
Credits Attainable	1
Credit Requirement	1 credit for implementing a Construction IAQ Management Plan, undertaking a building 'flush out' or 'bake out', and replacement of all filters prior to occupancy.
Assessment	<ol style="list-style-type: none"> 1. Provide a Construction IAQ Management Plan that includes, at a minimum: <ol style="list-style-type: none"> 1.1. An overview of tasks to be executed; 1.2. A list of reference documents, including environmental legislation and guidelines; 1.3. A list of participants in the process and their responsibilities; 1.4. A plan for management, communication and documentation; 1.5. Construction IAQ management plan control measures [1] on: 1.6. HVAC protection, source control, pathway interruption, housekeeping, scheduling; 1.7. Monitoring and auditing of implementation; 1.8. Expected written work products, including checklists and worksheets; and 1.9. A schedule of activities. 2. Provide monthly report(s) with dated photographic evidence demonstrating the effective implementation of the Construction IAQ Management Plan during the indoor construction period. A master programme shall also be included. <p>The report(s) shall be reviewed and endorsed by the Construction BEAM Pro (or BEAM Affiliate) as defined under IDCM 6 or Project BEAM Pro as defined under IDCM P1.</p> <p>Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring that the contractors carry out considerate measures, if indoor construction has not yet commenced at PA stage.</p> 3. Provide a report to demonstrate: <ol style="list-style-type: none"> 3.1. Technical information for the filtration media used during construction and installed immediately prior to occupancy; 3.2. Details of building flush-out procedures including actual dates of the flush-out;

1 Sheet Metal & Air Conditioning Contractors' National Association (SMACNA). ANSI/SMACNA 008•2008 Guidelines for Occupied Buildings Under Construction. Chapter 3. [ONLINE] Available at: <https://www.smacna.org/store/browse-by-topic/indoor-environmental-air-quality> [Accessed 5 July 2017]

- 3.3. The filtration media used had a Minimum Efficiency Reporting Value (MERV) of 13 as determined by ANSI/ASHRAE 52.2-2012 [2] or equivalent performance specification;
- 3.4. A flush-out with new filtration media is being carried out after the completion of construction and prior to occupancy;
- 3.5. Flushing duration as defined by calculation of the fresh air required to attain the IAQ certification 'good' class requirement;
- 3.6. No construction work done in the vicinity of the space during the flushing out; and
- 3.7. The space was protected against any recontamination after flushing out.

The report shall be reviewed and endorsed by the Construction BEAM Pro (or BEAM Affiliate) as defined under IDCM 6 or Project BEAM Pro as defined under IDCM P1.

Provide extracts of tender documents, contract conditions and/or specifications highlighting the clause requiring that the contractors carry out considerate measures, if indoor construction has not yet commenced at PA stage.

IDCM 10 Considerate Construction

Extent of Application	All buildings
Objective	Encourage care of workers, mitigate nuisances to immediate neighbours and promote good practices of tree protection during construction.
Credits Attainable	1
Credit Requirement	<p>1 credit for demonstrating considerate measures to the neighbourhood, passers-by and workers. Good tree protection practices where tree preservation within the project <i>site</i> is required, should also be carried out.</p> <p>Note:</p> <ol style="list-style-type: none"> 1) Partial credit shall be awarded for individual construction stages (i.e. demolition, foundation and <i>superstructure</i> in a default ratio of 1:1:3). The Applicant may submit justification and propose an alternative ratio based on the relative pollution control extent and resource demand in various construction stages. For a project covering all 3 stages, the partial credit attainable for demolition, foundation and <i>superstructure</i> are 0.2, 0.2 and 0.6 respectively. Similarly, for a project where demolition is not required or not under the Client’s control, the partial credit attainable for foundation and <i>superstructure</i> are 0.25 and 0.75 respectively. 2) All applicable stages must be attempted to attain any partial credit.
Assessment	<ol style="list-style-type: none"> 1. Considerate measures to (a) neighbourhood, passers-by and (b) workers, shall be reference to assessment criteria recommended in “Being Considerate to Neighbourhood and Passers-by” and “Care of Workers and Others” in the Considerate Contractors <i>Site</i> Award Scheme Guidelines [1,2]. A checklist of considerate measures is provided in the prescribed form. 2. Good tree protection practices shall make reference to the Guideline in “Tree Preservation during Development by Greening, Landscape and Tree Management Section” of Development Bureau, HKSAR Government [3]. A checklist of good tree protection practices is provided in the prescribed form. 3. Provide quarterly report(s) with the completed prescribed form and dated photographic evidence to demonstrate the implementation of considerate measures to (a) neighbourhood, passers-by, and (b) workers during construction (demolition and foundation to be included, if any); and the application of corrective actions to avoid continuous dissatisfaction/non-compliance of any item(s).

IDCM 11 Building Management Manuals

Extent of Application	All buildings
Objective	Encourage the provision of a fully documented operations and maintenance manual to enable building operators to implement the design intent and a fully documented energy management manual containing instructions that enables systems to operate at a high level of energy efficiency.
Credits Attainable	1
Credit Requirement	1 credit for providing a fully documented Operations and Maintenance Manual and Energy Management Manual.
Assessment	<p>1. Building Operations and Maintenance Manual (O&M Manual)</p> <p>1.1. The O&M Manual shall include the followings:</p> <ul style="list-style-type: none"> 1.1.1. the design intent; 1.1.2. the basis of design; and 1.1.3. full sequences of operation for all equipment and systems, including HVAC&R systems and associated controls, light and daylighting controls, domestic hot water systems and renewable energy systems; all of which must meet the legal requirements and industry wide standards. <p>1.2. The description of the design intent shall include as a minimum:</p> <ul style="list-style-type: none"> 1.2.1. space temperature and humidity criteria 1.2.2. levels operator and/or occupant control over HVAC systems; 1.2.3. ventilation requirements and related indoor air quality criteria 1.2.4. performance criteria related to energy efficiency; 1.2.5. environmental responsiveness of the facility; 1.2.6. and commissioning criteria. <p>1.3. The basis of design shall include at a minimum:</p> <ul style="list-style-type: none"> 1.3.1. details of occupancy; 1.3.2. space activity and any process requirements; 1.3.3. applicable regulations, codes, and standards; 1.3.4. design assumptions; 1.3.5. performance standards and benchmarks; and 1.3.6. control system appropriate for the skill of the operations and maintenance staff. <p>1.4. The operations and maintenance manual must include for each piece of equipment and each system:</p> <ul style="list-style-type: none"> 1.4.1. the name and contact information of the manufacturer or vendor and installing contractor; 1.4.2. submittal data; and 1.4.3. operations and maintenance instructions with the models and features for the subject <i>site</i> clearly marked. <p>1.5. The manual shall include only data for equipment that is actually installed, and include the following:</p> <ul style="list-style-type: none"> 1.5.1. instructions for installation, maintenance, replacement, start-up; 1.5.2. special maintenance requirements and sources for replacement parts/equipment;

- 1.5.3. parts list and details of and special tooling requirements;
- 1.5.4. performance data; and
- 1.5.5. warranty information.
- 1.6. The manual shall include an as-built documentation package for controls covering the followings:
 - 1.6.1. control drawings and schematics;
 - 1.6.2. normal operation;
 - 1.6.3. shutdown;
 - 1.6.4. unoccupied operation;
 - 1.6.5. seasonal changeover;
 - 1.6.6. manual operation;
 - 1.6.7. controls set-up and programming;
 - 1.6.8. troubleshooting;
 - 1.6.9. alarms; and
 - 1.6.10. final sequences of operation.

2. Energy Management Manual (EMM)

- 2.1. The EMM for all energy-related systems shall include the following:
 - 2.1.1. Descriptions of the final design intent and basis of design, including brief descriptions of each system;
 - 2.1.2. Final sequences of operations for all equipment;
 - 2.1.3. Procedures for seasonal start-up and shutdown, manual and restart operation;
 - 2.1.4. As-built control drawings;
 - 2.1.5. For all energy-saving features and strategies, rationale description, operating instructions, and caveats about their function and maintenance relative to energy use;
 - 2.1.6. Recommendations and brief method for appropriate accounting of energy use of the whole building;
 - 2.1.7. Specifications for re-calibration frequency of sensors and actuators by type and use;
 - 2.1.8. Recommendations for continuous commissioning or recommended frequency for re-commissioning by equipment type, with reference to tests conducted during initial commissioning;
 - 2.1.9. Recommendations regarding seasonal operational issues affecting energy use;
 - 2.1.10. List of all user-adjustable set points and reset schedules, with a discussion of the purpose of each and the range of reasonable adjustments with energy implications;
 - 2.1.11. Schedules of frequency for reviewing the various set points and reset schedules to ensure they still are near optimum;
 - 2.1.12. List of time-of-day schedules and a frequency to review them for relevance and efficiency;
 - 2.1.13. Guidelines for establishing and tracking benchmarks for building energy use and primary plant equipment efficiencies;
 - 2.1.14. Guidelines for ensuring that future renovations and equipment upgrades will not result in decreased energy efficiency and will maintain the design intent;
 - 2.1.15. List of diagnostic tools, with a description of their use, that will assist facility staff for the building in operating equipment more efficiently;
 - 2.1.16. A copy of the commissioning report; and
 - 2.1.17. Index of all commissioning documents with notation as to their location.

2 Integrative Design and Construction Management **2.2 Green Construction Practices**

IDCM 12 Operator Training plus Chemical Storage and Mixing Room

Extent of Application All buildings

Objective Encourage the provision of training for operations and maintenance staff to the minimum specified and demonstrate adequate maintenance facilities are provided for operations and maintenance work.

Credits Attainable 1

Credit Requirement 1 credit for providing training for operations and maintenance staff to the minimum specified; and demonstrating that adequate maintenance facilities are provided for operations and maintenance work.

Assessment **(a) Operator Training**

1. The training program should be carried out by the appointed Facilities Management Team or client representatives.
2. The training program shall cover as a minimum the items listed below:
 - 2.1. General purpose of each building system including basic theory of operation, capabilities and limitations, and modes of control and sequences of operation;
 - 2.2. Review of control drawings and schematics;
 - 2.3. Procedures for start-up, shutdown, seasonal changeover, normal operation, unoccupied operation and manual operation;
 - 2.4. Controls set-up and programming;
 - 2.5. Troubleshooting;
 - 2.6. Alarms;
 - 2.7. Interactions with other systems;
 - 2.8. Operational monitoring and record keeping requirements, and the use of data for analyzing system performance;
 - 2.9. Adjustments and optimizing methods for energy conservation;
 - 2.10. Any relevant health and safety issues;
 - 2.11. Inspection, service, and maintenance requirements for each system, including any need for specialised services;
 - 2.12. Sources for replacement parts/equipment; and
 - 2.13. Any tenant interaction issues.
3. The demonstration portion of the training program shall include at least the following:
 - 3.1. Operation typical examples of each system;
 - 3.2. Start-up and shutdown procedures;
 - 3.3. Operation under all specified modes of control and sequences of operation;
 - 3.4. Procedures under emergency or abnormal conditions; and
 - 3.5. Procedures for effective operational monitoring.
4. Verify that the training of the building's operations and maintenance staff was undertaken for all commissioned systems and major equipment, using the operations and maintenance manual, and the energy management manual as the basis for the training. Demonstrate that the provided operation and maintenance facilities are adequate.
5. A permanent room for training is not necessary. Evidence of carrying out operator training (e.g. record of attendance) is required.

(b) Chemical Storage & Mixing Room

1. A centralised chemical storage and mixing room for each individual building in the *site* (i.e. janitor and central storage area) should be provided where buildings include provision of housekeeping and chemical products that create odour during their mixing processes (non-residential spaces which will be managed and maintained for multiple occupants usage). Chemical products include refrigerants, cleansing chemicals for all building items and equipment.
2. *Residential building* (including clubhouse) that without chillers, chemical storage and mixing room is not required.
3. No size requirement for the chemical storage mixing room.
4. Submit details in the form of drawings and a report with ventilation calculation to demonstrate the following chemical storage and mixing areas provision:
 - 4.1. A drainage point and a water supply point;
 - 4.2. A separate exhaust route for ventilation system to maintain negative pressure with respect to adjacent spaces when the doors to the room are closed;
 - 4.3. A separate area with self-closing and lockable door; and
 - 4.4. Deck-to-deck-partitions.

2.3 Smart Design and Technologies

IDM 13 Digital Facility Management Interface

Extent of Application	All non- <i>residential building</i> and common areas of <i>residential buildings</i>
Objective	Encourage provision of digital interfaces to enable future facility management teams to review the building operation performance
Credits Attainable	1
Credit Requirement	1 credit for providing a digital interface in addition to the project design metering provision for future facility management team to review the building operation performance.
Assessment	<p>Develop a digital interface for future facility management team to review data collected by the electricity metering system installed in the building. The assessment focuses on the interface provision for providing vision regarding operation characteristics. This is for future implementation of first class (Cat I) energy management opportunities (EMOs), with reference to the Code of Practice for Building Energy Audit 2015 [1]. Metering system design and hardware quality is not assessed in this credit.</p> <p>The interface should be a provisional media, providing information for the future facility management team to review the building operation. The format and media used for the interface is free providing that the credit objectives are achieved by meeting the below requirements:</p> <ol style="list-style-type: none"> 1) Providing charts and summaries for data collected in sub-metering systems. Minimum data require should reference EU 4 Metering and Monitoring part (a) ii. 2) Providing hourly energy consumption data for equipment and data collected in sub-metering systems. The minimum data required should reference to EU 4 Metering and Monitoring part (a) ii. 3) Equipment day-to-day operational records compared to design information if applicable: including: <ul style="list-style-type: none"> - Room temperature; - Chilled water temperature; and - Equipment operation hours. 4) Provide EUI for the following systems (if present) monthly : HVAC system, lift system, escalator system, lighting system, plumbing and drainage system and service hot water system. 5) Keeping inventories and records of the identified systems, including manuals, technical brochures indicating their configurations and characteristics. 6) Providing a trend of total building electricity use for the last 12 months. To demonstrate compliance, the interface should produce a trend containing data collected in the previous months prior to Final Assessment since commissioned, which can be less than 12 months of data. 7) Providing a trend of total electricity costs for the last 12 months. To demonstrate compliance, the interface should produce a trend containing data collected in the previous months prior to Final Assessment since commissioned, which can be less than 12 months of data.

¹ Electrical and Mechanical Services Department – Code of Practice for Building Energy Audit 2015. [ONLINE] Available at: http://www.beeo.emsd.gov.hk/en/pee/EAC_2015.pdf. [Accessed 11 July 2017].

- 8) As-built drawing and system schematic that shows the layouts of energy consuming equipment and systems, and drawings showing the layout of the building.
- 9) Providing Operation and Maintenance programmes that include the timing of major alterations, additions or replacements for the building.

For commercial development applicants, which have not achieved EU 4 Metering and Monitoring, will not be awarded this credit.

For residential development applicants, achievement of EU 4 is not required as the basic requirement in assessing this credit.

2 Integrative Design and Construction Management **2.3 Smart Design and Technologies**

IDCM 14 Occupant Engagement Platform

Extent of Application All non-residential buildings

Objective Encourage the provision of digital platforms to connect building occupants and the building status to drive behaviour change.

Credits Attainable 1 BONUS

Credit Requirement 1 BONUS for providing a digital platform to engage building occupants.

Assessment Develop a digital platform for future occupants to understand the building status. The platform shall contain information to be reviewed by the respective occupant only. The digital platform should contain data referenced to the EU 4 part (a) requirement and provide the following information:
 1) Description of green measures implemented in the building;
 2) Energy consumption in the occupants' respective leased spaces;
 3) Recommendations to conserve energy use in the building; and
 4) Healthy lifestyle tips.
 The digital platform should be in a form of one of the followings:
 1) Digital displays in at least one common area accessible by all occupants;
 2) Mobile applications accessible by all occupants; and

In conjunction with IDCM 3c Early Consideration Of Operational Issues, it is recommended to consult the facility management team while specifying the document management system.

2 Integrative Design and Construction Management

2.3 Smart Design and Technologies

IDCM 16 BIM Integration

Extent of Application

All buildings

Objective

Encourage the design team to discuss and work through the design platform and deliver holistic solution using Building Information Modelling (BIM)

Credits Attainable

1 + 3 BONUS

Credit Requirement

(a) Coordinated use of BIM within design teams

1 credit for the coordinated use of BIM amongst the design team.

(b) Coordinated use of BIM within design and construction teams

1 BONUS for coordinated use of BIM amongst the design team and the contractors.

(c) BIM for time

1 BONUS for using the BIM model for scheduling, cost and quantity, schedules preparation and tracking the project budget.

(d) BIM for facility management use

1 BONUS for updating the BIM model to as-built condition.

Assessment

(a) Coordinated use of BIM within design teams

1. Prepare a project execution plan including the following content:

- 1.1. Project BIM objectives;
- 1.2. Model Level of Development (LOD);
- 1.3. Methods of communication;
- 1.4. Project BIM standards; and
- 1.5. Model / Data validation protocols.

2. Demonstrate coordinated use of BIM among design teams which at a minimum includes the following members:

- 2.1. Architects / project designers;
- 2.2. MEP engineers; and
- 2.3. Structural engineers.

3. Demonstrate the use of BIM performing the following functions:

- 3.1. Coordinate spatial design;
- 3.2. Clash detection; and
- 3.3. Building performance simulation.

4. The BIM model should be at least LOD 300 as defined in The American Institute of Architects (AIA) Project Building Information Modelling Protocol Form [1].

(b) BIM for contractors

In addition to requirements in a), demonstrate coordinated use of BIM among design teams and the contractors.

(c) BIM for time

1. Demonstrate the use of BIM performing the following functions:
 - 1.1. Report real time on-site construction activity;
 - 1.2. Review construction progress against the construction programme;
 - 1.3. Prepare cost and quantity schedules; and
 - 1.4. Track project budget.

(d) BIM for facility management use

Update the BIM model to the as-built condition including fixtures, finishes and equipment data.

Demonstrate the BIM will be handed over to facility management team for facility management use.

The use of BIM is a valuable add-on to IDCM 3 Integrative Design Process as it facilitates integrative design by tightening coordination within the project team.

BETA

3	Sustainable Site	3.P Prerequisite
		3.1 Neighborhood Integration
		3.2 Ecologically Responsible Design
		3.3 Bioclimatic Design
		3.4 Climate Resilience and Adaptability

Introduction

This section focuses on the planning and design to harness the sustainable design potentials of a *site* for its occupants and neighbours, preserve/ enhance its ecological capacity, optimize its microclimate and create better climate resilience. *Site* attributes and scale of development have been taken account of in the formulation of the assessment criteria. *Site* locations *Site* planning and design strategies in the following aspects will be assessed for their sustainable design quality and performances:

- Building disposition, *orientation* and form;
- spatial relationship of the building(s) to the immediate built and natural environment;
- relationship of the building(s) to the *site* topography and ground conditions;
- overall massing of the proposed development;
- *Site* coverage of greenery, choice of plant species, tree coverage/ preservation;
- view factors and ambient forces;
- balance of built-up and landscaped/open area;
- environmental enhancement to the surroundings of the *site*; and
- master landscaping strategy; and
- conservation and protection of archaeological remains, historic buildings and monuments.

3.P	Prerequisite	SS P1 Minimum Landscaping Requirements
------------	---------------------	---

Background

This part is to set out the minimum requirements on *site* coverage of greenery and provisions for viability of planting for all buildings with *site* area of 1,000 m² or above.

3.1	Neighborhood Integration	SS 1 Pedestrian-oriented and Low Carbon Transport
		SS 2 Neighborhood Amenities
		SS 3 Building Design for Sustainable Urbanism
		SS 4 Neighborhood Daylight Access
		SS 5 Noise Control for Building Equipment

Background

Integration with the neighbourhood is addressed in terms of pedestrian-oriented transport, adequacy of local amenities, sustainable urban design, daylight access for neighbouring sensitive receivers and reduction of noise from building services equipment to neighbours.

The planning and design issues which affect the environmental performance of a *site* and master layout planning should include:

- Disposition of individual buildings within the *site*;
- Spatial relationship of the building(s) to the immediate built and natural environment;
- Relationship of the building(s) to the *site* topography and ground conditions;
- Overall massing of the proposed development;
- Built form of the buildings;
- *Orientation* of buildings in relationship to view factors and ambient forces;
- Balance of built-up and landscaped/open area;
- Environmental enhancement to the surroundings of the *site*; and
- Master landscaping strategy;

- Conservation and protection of archaeological remains, historic buildings and monuments.

Tall buildings can cause substantial overshadowing of neighbouring developments and amenities, affecting both direct and indirect sunlight and light from the sky. Noise emissions from equipment on and around buildings contributes to noise pollution with potential impacts on neighbouring properties. It is the responsibility of the project team to alleviate adverse effect on neighbouring properties by good design and proper installation and maintenance.

3.2 Ecologically Responsible Design

SS 6 Light Pollution Control SS 7 Ecological Preservation / Enhancement

Background

Habitat conservation is the most effective means to minimize development impacts on the natural environment and endangered species (if any). If an area of high biodiversity is identified in the *site*, it is encouraged to formulate management strategies to protect habitats and any rare or endangered species within the land under ownership.

Light pollution may be regarded as waste light from lighting schemes that produces glare, obscures the night sky, adversely effects nocturnal ecosystems and may intrude on neighbouring properties.

3.3 Bioclimatic Design

SS 8 Urban Heat Island Mitigation SS 9 Immediate Neighborhood Wind Environment SS 10 Outdoor Thermal Comfort

Background

The use of non-reflective external surfaces contributes to localised elevated temperatures created when solar heat gains are absorbed and then radiated back to the surroundings. The effect may be local to pedestrian and recreational areas and contribute to urban heat islands.

Site planning, building design and landscaping strategies can enhance a *site's* microclimate. Elevated temperatures can be mitigated through the choice of finishes on buildings and horizontal hard surfaces that reflect heat, the application of shading or planted vegetation, and the enhancement of building permeability.

3.4 Climate Resilience and Adaptability

SS 11 Stormwater Management SS 12 Design for Climate Change Adaptation

Background

Hong Kong is located along the common track of tropical cyclones and hence Hong Kong experiences very heavy rainstorms at times. In the New Territories, the area is characterized by its wide floodplain and low lying terrain. In the past decades, rapid urbanization has turned natural ground to hard paved impervious areas. In the old built-up areas in Kowloon and in parts of Hong Kong Island, insufficient drainage capacity and dense land development aggravate the potential for flooding in the neighbourhoods. The climate change brings further challenges such as sea level rise and increased occurrence of extreme weather.

A high standard of stormwater management can reduce the risk of flooding and promote groundwater recharge. The "Sponge City" benchmarks to control the total stormwater run-off volume in Mainland China (Shenzhen) has been taken as reference in formulating the standards. Furthermore, the impact of projected climate change scenarios on building development are also encouraged. Using available local or national best practice industry standard weather data, a study on the projected variations in temperature, rainfall and storm surge, that will occur based on a building life cycle of 50 years as a result of climate change, is carried out and respective strategies to improve climate

resilience are considered.

BETA 0

3 Sustainable Site 3.P Prerequisite**SS P1 Minimum Landscaping Requirements**

Extent of Application	All sites with site area of 1,000 m ² or more.
Objective	Encourage building development to preserve or expand urban greenery.
Credits Attainable	Prerequisite
Credit Requirement	Prerequisite achieved for demonstrating compliance with minimum planting provisions in terms of viability and site coverage of greenery of at least 20% of the site.

Assessment**(a) Minimum provisions for viability of planting**

1. Submit tree survey plans and tree assessment schedules if there are existing trees and highlight any trees to be preserved.
2. Reserve sufficient vertical and horizontal soil space for preserved, transplanted or added trees and all planted areas:
 - 2.1 Soil volume per tree shall be at a minimum of 12m³;
 - 2.2 Soil depths shall be at least 1.2m, 0.6m and 0.3m for trees, shrubs and grass / ground covers respectively.
3. Demonstrate by citing relevant literature or reference that plant species used for covered greenery belong are shade tolerant.
4. Provide at least a means of irrigation for planting areas.
5. Provide maintenance access to planting areas.

(b) Minimum site coverage of greenery

1. Provide a minimum of 20% overall site coverage of greenery (method of measurement and calculation of site coverage of greenery except otherwise stated below shall be in accordance with Buildings Department PNAP APP-152 *Sustainable Building Design Guidelines* [1]):
 - 1.1 The minimum site coverage of greenery in the primary zone required in the PNAP is not assessed under this prerequisite.
 - 1.2 Covered greenery areas above the primary zone (measured from 45° projected line taken from the edge of building) in communal areas accessible to public, occupiers or visitors shall be counted (50% reduction factor applies).
 - 1.3 Vertical greening within 15m vertical zone from communal areas accessible to public, occupiers or visitors shall be counted (no reduction factor applies but vertical frames with a height more than 7.5m are not accountable for vertical greening provided by climbing or weeping plants).
 - 1.4 The maximum accountable percentage of greening features stated in the PNAP Appendix D is not assessed under this prerequisite.

Buildings Department - PNAP APP-152 *Sustainable Building Design Guidelines*

(b) Related Credits

SS 1 Pedestrian-oriented and Low Carbon Transport

The related credit encourages the shading of main pedestrian paths by trees. The soil space of trees shall meet the minimum standards stipulated in SS P1.

SS 8 Urban Heat Island Mitigation

The related credit encourages higher overall *site* coverage of greenery and stipulates minimum *site* coverage of greenery in the *Primary Zone* (the 15m vertical zone of a *site* along the abutting street level).

SS10 Outdoor Thermal Comfort

The related credit considers the positive effect of shading by trees and the surrounding ground surface temperatures of greenery within the *site*.

SS 11 Stormwater Management

The related credit considers softscape provided with the *site* for infiltration and detention in stormwater management.

WU 2 Water Efficient Irrigation

The related credit considers water efficient irrigation for greenery provided within the *site*.

HWB 2 *Biophilic Design*

The related credit encourages human-nature connection for building occupants.

BETA 0

3 Sustainable Site

3.1 Neighbourhood Integration

SS 1 Pedestrian-oriented and Low Carbon Transport

Extent of Application

All buildings.

Objective

Encourage the use of pedestrian-oriented, low carbon and/ or public transport, with an aim to create a safer, more sustainable and appealing environment that promotes human interaction, a sense of place as well as integration with surrounding pedestrian transport network.

Credits Attainable

2 + 3 BONUS

Credit Requirement

(a) Accessibility to public transport

1 credit for achieving Accessibility Index of 15 or more for all buildings of a development.

(b) Pedestrian-oriented access

1 credit for achieving 50% or more of the applicable pedestrian-oriented transport planning measures.

1 additional BONUS credit for achieving 100% of the applicable pedestrian-oriented transport planning measures.

(c) Cycling facilities and network integration

1 BONUS credit for providing cycling facilities within the *Site* and integrating with the public cycling network if a public cycling network exists or has been planned nearby.

(d) Charging facilities for Electric Vehicle (EV)

1 BONUS credit for providing EV charging facilities for at least half of the carparking spaces (including visitor car parks).

Assessment

(a) Accessibility to public transport

1. Indicate distances shown alongside unhampered walking routes within a walking distance of 1,000m within a walking distance of 1,000m from the *site* main entrance(s) to each public transport [1] stop or the main entrance of each station in vicinity on an A3-sized scaled drawing.
2. Provide evidence of service frequencies of public transport.
3. Calculate Accessibility Index (AI) [2] for all buildings of a development using the spread sheet template [3].
 - 3.1. Use service frequency data at peak periods for waiting time calculation.
 - 3.2. Adopt a walking speed of 100m per minute for calculation of walk time.
 - 3.3. For a walking route using a mechanical means to assist pedestrian movement, provide evidences to demonstrate:
 - 3.3.1. The mechanical means shall be in operation either at least between 7am to 7pm every day or a period that meets the specific needs of building users (occupancy pattern of the project to be justified by the Applicant);
 - 3.3.2. Mapping of the start and end points of the mechanical means to be shown on a scaled drawing, and
 - 3.3.3. Calculation of combined horizontal commuting time (walk times and the horizontal commuting times of the mechanical means to the public transport services (wait time for vertical transportation to be excluded), with substantiation by

1 Public transport includes railways, bus (franchised bus/ non-franchised public bus), green minibus (GMB), tram and ferry
2 Transport for London. Measuring Public Transport Accessibility Levels. [ONLINE] Available at:
<https://files.datapress.com/london/dataset/public-transport-accessibility-levels/PTAL-methodology.pdf> [Accessed 5 July 2017]
3 BEAM Society Ltd. – Accessibility Index Calculation Spread Sheet Template.

supplier's information on the commuting speed of the mechanical installation. The combined horizontal commuting time to the public transport services shall not be more than 10 minutes.

4. Provide evidence issued by a government agency or a quasi-government body for the targeted operation date of any future public transport services/ facilities. Future services/ facilities provisions not operable at the time of building completion will be accepted if they will be in operation no later than one year after the occupation of the proposed development.
5. For a *site* served by dedicated shuttle service vehicles for the development and to be considered under the AI method, provide:
 - 5.1. Notification of services provisions by the service provider to building users confirming:
 - 5.1.1. Routes and stops of the shuttle services providing connection links to public transport,
 - 5.1.2. Capacity of shuttle service vehicles,
 - 5.1.3. Locations of shuttle service drop-off/ pick-up points, and
 - 5.1.4. Operating frequency of the services.
 - 5.2. Justification of the adequacy of the service if the capacity of the shuttle service vehicles is below 16 passengers.
 - 5.3. An undertaking letter by the developer/ property owner for the provision of the shuttle service for a minimum of 5 years. A minimum 1 year rolling contract in place with the service provider shall be submitted.

(b) Pedestrian-oriented access

1. Demonstrate compliance for applicable pedestrian-oriented transport planning measures using the following checklist:
2. Complete the checklist in the submission template whether the following sub-items are achieved or not.
3. Provide justifications for each achieved sub-item and descriptions with illustrations, drawings and photos of measures adopted.
4. Provide justifications for each non-applicable sub-item.

Safe Environment	Pt	Convenient Environment	Pt	Pleasant Environment	Pt
Segregation between main pedestrian pathways and vehicular traffic for private cars/ taxis within the <i>Site</i> if there is no speed limit or the targeted speed is higher than 20 km/h.	1 or	Short and direct pathways as compared to vehicular access/ pathways.	1	Car parking spaces not exceeding minimum requirement from government, excluding parking for shuttle service vehicles.	1 or
Vehicular traffic calming measures adopted and speed limit signs provided for a speed of no more than 20 km/h for over 50% of roads within the <i>Site</i> .	1 or	Minimised level changes for pathways meeting recommended design requirements of barrier-free access in Chapter 4 of BFA 2008.	1	No car parking is provided other than provisions intended for use by people with a disability and for shuttle service vehicles.	2

Vehicular traffic calming measures adopted and speed limit signs provided for a speed of no more than 20 km/h for 100% of roads within the <i>Site</i> .	2	Widths of street furniture and greening zones along main pedestrian pathways meeting recommended widths by Table 9 of HKPSG Chapter 8 [4].	1	Planting zone of a minimum width of 1 m along main pedestrian pathways.	1
				Main pedestrian pathways under covered or shaded by trees.	1
Whole length of <i>main pedestrian access pathways</i> to be overlooked from any <i>normally occupied spaces</i> of buildings within or outside the <i>site</i> .	1	Widths for main pedestrian pathways meeting recommended widths by Table 9 of HKPSG Chapter 8 [3].	1	Pedestrian pathways designed with high architectural/landscape quality, with design features intended for human delight/celebration of culture or public art.	1
Lighting of the illuminance of all pedestrian pathways within the <i>site</i> is at least 50 lux.	1	Clear and easily understood wayfinding signage is sited prominently and in predictable locations within the <i>Site</i> .	1		

Note:

1. Main pedestrian pathways are defined as pathways of width not less than 2m for pedestrian circulation from building main entrance(s) to *site* entrance(s) or amenities within the *site*.
5. The following assessment requirements for car parking facilities shall be complied for scoring the first point under pleasant environment:
 - 5.1. The car parking spaces not exceeding minimum requirement from government (lease/ engineering conditions). If no requirement is stipulated in lease/ engineering conditions, the lower bound number of any recommended range in HKPSG Chapter 8 [3] or Transport Department (TD)'s advice shall be followed;
 - 5.2. Simultaneous free flow of vehicles in and out of the car park at the point of access, and
 - 5.3. Provisions to avoid ground contamination from oil run-off either by:
 6. Petrol interceptors for covered parking spaces, and
 7. Petrol interceptors or, if there is no open transport interchange/ vehicular servicing area, pervious paving and construction with a maximum gradient of 1:20, a depth of at least 600mm from top surface of paving to anticipated highest water table, and a permeability rate of at least 0.1mm/sec for open parking spaces.
 8. Demonstrate that the width of each horizontal screen, covered walkway or trellis over main pedestrian pathways shall be at least 2m.
 9. If shading for main pedestrian pathways is provided by trees at-grade, demonstrate by an ecologist or a landscape architect that:

4 Planning Department. Hong Kong Planning Standards and Guidelines. Chapter 8: Internal Transport Facilities [ONLINE] Available at: http://www.pland.gov.hk/pland_en/tech_doc/hkpsg/full/ch8/ch8_text.htm [Accessed 5 July 2017]

- 9.1. The shade provided should be a continuous strip of trees planted along the pedestrian route.
- 9.2. Suitable species of broadleaved trees (not palms conifers) with sufficient anticipated crown diameters are provided to offer shade.
- 9.3. The tree coverage shall be measured using estimated crown diameters 10 years after landscape installation, with evidence of crown measurement of the species taken in similar local growing conditions.
- 9.4. A shaded pedestrian route of a minimum width of 2m under the trees shall be demonstrated on plan.

(c) Cycling facilities and network integration

1. Demonstrate that there is a public cycling network within 500 m walking distance from the perimeter of the *site*, either existing or planned (to be in operation no later than one year after the occupation for the proposed Project).
2. Demonstrate that the following facilities are provided by means of layout and drawings, supplementary calculations and photos of the installed facilities:
 - 2.1. Cycling tracks and parking facilities complying with the requirements in Section 6 – Cycling of Internal Transport Facilities presented in the Chapter 8 of HKPSG [5] or Transport Department (TD)'s requirements.
 - 2.2. The cycling tracks comply with the following conditions:
 - 2.2.1. A continuous cycling network within the *Site* and the existing/ planned public cycling network if the public cycling network is immediately adjacent to the *Site*, and
 - 2.2.2. The cycling network within the *Site* shall have physically designated in-/ off-street cycle tracks, or are integrated with roads designed for a target speed of 20 km/h or slower.
 - 2.3. For non-residential projects or non-residential portion of mixed-use projects, shower and changing facilities of at least one shower for the first 100 regular building occupants (excluding occasional visitors) and one additional shower facility for every additional 150 regular building occupants users.

(d) Charging facilities for Electric Vehicles (EV)

1. Provide descriptions with illustrations, schematic drawings and photos of the EV charging facilities and demonstrate that the facilities are provided for at least half of the carparking spaces (including visitor car parks).
2. Demonstrate that the EV charging facilities provided meet the following requirements:
 - 2.1. The facilities provide 1 phase 32A current or above for semi-quick charging of EV;
 - 2.2. Sockets/ connectors provided are widely applicable for various EV brands/ types of the market;
 - 2.3. Semi-quick chargers with both American SAE standard and European IEC standard sockets/ connectors shall be provided for all visitor car parks.

(b) Related Credits

SS P1 Minimum Landscaping Requirements

The related prerequisite requires minimum *site* coverage of greenery that may contribute to the design of a pleasant environment for pedestrians.

SS 2 Neighbourhood Amenities

The related credit promotes good pedestrian accessibility to amenities within and in the vicinity of the *Site*. Better integration of the surrounding pedestrian networks and pedestrian pathways within the *site* will achieve enhanced accessibility for building users and/ or the public.

SS 7 Ecological Preservation/ Enhancement

The related credit encourages preservation/ enhancement of existing habitat within the *site* that may contribute to the design of a pleasant environment for pedestrians.

SS 8 Urban Heat Island Mitigation

The related credit encourages higher overall *site* coverage of greenery and stipulates minimum *site* coverage of greenery in the *Primary Zone* (the 15m vertical zone of a *site* along the abutting street level). The enhanced greenery in the *Primary Zone* will contribute to a more pleasant pedestrian environment.

SS 10 Outdoor Thermal Comfort

The related credit considers the positive effect of shading by trees and the surrounding ground surface temperatures of greenery within the *site*.

SS 11 Stormwater Management

The related credit considers hardscape and softscape provided with the *site* for infiltration and detention in stormwater management that may contribute to the design of a pleasant environment for pedestrians and the pervious construction to avoid ground contamination from oil run-off for open carpark.

3 Sustainable Site 3.1 Neighbourhood Integration

SS 2 Neighbourhood Amenities

- Extent of Application** All buildings.
- Objective** Encourage building development that is integrated within, and an asset to, the immediate neighbourhood.
- Credits Attainable** 2
- Credit Requirement**
- (a) Amenities for building users**
1 credit where adequate amenities for building users are located within the *site* or 500m walking distance/ an equivalent horizontal commuting time from the *site* entrance(s).
- (b) Shared amenities for neighbourhood**
1 credit where adequate shared amenities for the neighbourhood are provided within the *site* and are made available for public use.
- Assessment**
- (a) Amenities for building users**
1. Provide a report based on a survey of the immediate neighbourhood and the development itself to demonstrate that at least 15 amenities for building users are located within the *site* or 500m walking distance from the *site* entrance(s) to the main entrances of the amenities or the common entrance of a collective amenity (a complex comprising 2 or more amenities).

Building Amenities	Building types

Legend:

- C Core amenity for building type
 ✓ Amenity relevant to building type
 * Definition referred to in HKPSG Chapter 3 / Chapter 4 [2]

Building Types:

C1	<i>Commercial buildings</i>	Office / Retail / Mixed-use
C2		Hotel
E1	<i>Educational buildings</i>	Pre-school / Primary / Secondary School
E2		Tertiary / Post-secondary Education / Universities
R	<i>Residential buildings</i>	
O	<i>Other building types</i>	

2. Indicate lines and distances shown alongside of unhampered walking routes from the *site* entrance(s) to the main entrance of each amenity or each collective amenity in vicinity on an A3-sized scaled drawing.
 - 2.1 When there are multiple *site* entrances in a development, the one having the least numbers of amenities complying with the credit requirements shall be demonstrated for compliance.
3. Demonstrate that the available amenities shall include at least 2 different *core amenities* (*core amenities* are regarded the most vital and essential basic services / recreational facilities) referred above for:
 - 3.1 Office, retail or mixed-use buildings;
 - 3.2 Pre-school, primary or secondary school;
 - 3.3 Tertiary, post-secondary education or universities, and

1 Public entertainment means any entertainment to which the general public is admitted with or without payment (ref. to Cap 172 Places of Public Entertainment Ordinance, HKSAR)

2 Planning Department. Hong Kong Planning Standards and Guidelines. Chapter 3: Community Facilities / Chapter 4: Recreation, Open Space and Greening. [ONLINE] Available at:
http://www.pland.gov.hk/pland_en/tech_doc/hkpsg/full/ch3/ch3_text.htm [Accessed 5 July 2017]
http://www.pland.gov.hk/pland_en/tech_doc/hkpsg/full/ch4/ch4_text.htm [Accessed 5 July 2017]

3.4 Residential buildings.

4. Count 2 or more of any relevant amenity as 2 amenities. For example, 3 cafes and 2 ATMs shall be counted as 4 amenities.
5. The predominant service of the development itself could be counted as an amenity for this credit. For example, a school development itself is countable as an amenity for this credit.
6. For a walking route using a mechanical means to assist pedestrian movement, provide evidences to demonstrate:
 - 6.1 The mechanical means having no restricted operating hour or in operation when the counted amenities are opened;
 - 6.2 Mapping of the start and end points of the mechanical means to be shown on a scaled drawing, and
 - 6.3 Calculation of combined horizontal commuting time (walk times and the horizontal commuting times on the mechanical means to amenities being no more than 5 minutes (wait time for vertical transportation to be excluded; walking speed of 100m per minute to be adopted for calculation of walk time)), with substantiation by supplier's information on the commuting speed of the mechanical installation.

(b) Shared amenities for neighbourhood

1. Demonstrate that at least 5 amenities referred in SA 2a are provided within the *Site* and will be made available for public use, and no core amenity is needed to be counted.
2. Provide evidence that prominent and permanent public signage is provided on *site* or at least one notice in the public domain (websites, regular publications available to the public, newspapers or other means proposed by the Applicant) is served to notify the public about the shared amenities for neighbourhood, and any arrangement to be made for using the facilities.
3. State any restrictions or conditions of access to the amenities that will be in place. Reasonable opening time restriction and / or fees charged for the use of the amenities by public shall be acceptable for this credit. Private clubhouses primarily for residents or building occupants of the proposed development shall not be counted in this credit requirement.

For both SA 2a and SA 2b:

4. Provide justifications to count amenities that are not listed in this credit for consideration. The justification shall be considered based on individual merits of the amenities, basic necessity, psychological and/ or physical well-being of the immediate neighbourhood.
5. Provide evidence for targeted opening schedules for future amenities provisions not operable at the time of building completion. The amenities can be counted if they will be in operation no later than one year after the occupation of the proposed development.

SS 1 Pedestrian-oriented and Low Carbon Transport

The related credit promotes good pedestrian accessibility to public transport. Better integration of the surrounding pedestrian networks and pedestrian pathways within the *site* will achieve enhanced accessibility for building users and/ or the public.

3 Sustainable Site**3.1 Neighbourhood Integration****SS 3 Building Design for Sustainable Urbanism**

Extent of Application	All buildings.
Objective	Encourage a people-oriented and place-making approach for sustainable urban design and conserve <i>cultural heritage</i> .
Credits Attainable	2 + 2 BONUS
Credit Requirement	<p>(a) Sustainable urban design</p> <p>1 credit for preparing a <i>site</i> design appraisal report demonstrating a proactive approach to achieve a people-oriented and place-making approach for sustainable <i>site</i> planning, and at least 30% of applicable sustainable urbanism measures are achieved.</p> <p>2 credits for achieving at least 60% of applicable sustainable urbanism measures.</p> <p>1 additional BONUS credit for achieving at least 90% of applicable sustainable urbanism measures.</p> <p>(b) Conservation of <i>cultural heritage</i></p> <p>1 BONUS credit for demonstrating that a proper heritage impact assessment mechanism and its recommendations have been implemented.</p>
Assessment	<p>(a) Sustainable urban design</p> <ol style="list-style-type: none"> 1. Complete a checklist in the submission template of this credit to indicate which sub-items are achieved, not achieved or not applicable. 2. Provide a <i>site</i> design appraisal report demonstrating a proactive approach to achieve relevant applicable sustainable urbanism measures for <i>public realm</i> (interpreted as public spaces within and surrounding the <i>Site</i> for socialization and enjoyment by the community), providing justifications on all achieved or not applicable sub-items of the following: <ol style="list-style-type: none"> 2.1 Avoid dwarfing effect in <i>public realm</i>, considering visual effect of building masses/ forms / heights from public spaces in relation to human scale. 2.2 Create or preserve visual corridors and prominent pedestrian linkages in <i>public realm</i> to less developed rural areas in urban fringe or towards adjacent public open spaces in vicinity. (This sub-item is not applicable for sites where there is no surrounding public open space or less developed rural area in vicinity.) 2.3 Create or preserve visual corridors in <i>public realm</i> from inland to the waterfront of the Victoria Harbour or major water bodies such as Inner Port Shelter, Junk Bay, Ma Wan, South China Sea, Tolo Harbour. (This sub-item is not applicable for inland sites where <i>public realm</i> has no view of the water bodies.) 2.4 Harmonize building masses/ forms / heights with the natural environment in rural areas or urban fringe. (This sub-item is not applicable for inland urban sites where <i>public realm</i> has no view of the natural environment.) 2.5 Avoid monotony by diversified but yet compatible building masses/ forms / heights in relation to topography or character of surrounding landscape/ developments. 2.6 Create stepped and compatible building height profile within the <i>Site</i> in relation to topography, water bodies or character of surrounding landscape / developments.

- 2.7 Preserve views to selected sections of ridgelines/ peaks by maintaining a 20% building free zone [1] as viewed from relevant vantage points [2], or give punctuation effects of the ridgelines by special landmark mega tower design with high quality architectural design at suitable locations [3]. (This sub-item is not applicable for inland *sites* that could not be seen from the afore-mentioned vantage points on both sides of Victoria Harbour.)
- 2.8 Preserve views to local building/ landscape features and public spaces from *public realm* by appropriate building masses/ forms / heights.
- 2.9 Open up or preserve view from *public realm* to any adjacent heritage feature. Arrange massing of larger elements of the new development furthest from an adjacent heritage feature and smaller elements of the massing closer to the feature. (This sub-item is not applicable for *sites* where there is no adjacent heritage feature.)
- 2.10 Provide building set-back (at least 2m from *site* boundary) from street and neighbourhood amenities along street to activate *public realm*. (This sub-item is not applicable for *sites* with no street frontage.)
- 2.11 Create building masses/ forms as high quality architectural landmark features in *public realm*/ waterfront to create *orientation* and a sense of place.
- 2.12 Provide public open spaces of diverse shapes and sizes for social and cultural events with prominent pedestrian linkages.
- 2.13 Avoid monotony by diversified but yet compatible building facade/ streetscape design in *public realm* (styles/ colours/ materiality/ architectural details) in relation to surrounding developments.
- 2.14 Define entrance(s) and focal point(s) in *public realm* to create a sense of place.
- 2.15 Provide high quality architectural design of seating, pedestrian signage, pavement surface and other street furniture in the *public realm* to strengthen human scale and to complement the character of the area or the adjacent developments.
- 2.16 Harmonise architectural design, especially in the lower floors, with an adjacent built heritage in terms of style, scale, proportion, colour and/ or materials (at least 2 of the above aspects). (This sub-item is not applicable for *sites* where there is no adjacent built heritage.)
- 2.17 Create landscape with seasonal colour changes and scenic effect to enhance street character.
- 2.18 Provide suitable landscaping to minimise negative visual impact of stilted structures on sloping *sites*. (This sub-item is not applicable for *sites* where there is no stilted structure.)

(b) Conservation of cultural heritage

1. Compile a comprehensive inventory of *cultural heritage* within or in the vicinity of the *Site* (interpreted as not more than 50m measured from the nearest point of the *site* boundary (inclusive of works area) in accordance with the Technical Circular (Works) No. 6/2009 for

(b) Related Credits

SS 1 Pedestrian-oriented and Low Carbon Transport

The related credit encourages pleasant pedestrian-oriented design and may help achieve the people-oriented and vibrant streetscape.

SS 2 Neighbourhood Amenities

The related credit encourages building developments to provide neighbourhood amenities and will help activate *public realm*.

SS 7 Ecological Preservation/ Enhancement

The related credit encourages habitat preservation/ enhancement that may contribute to the landscape quality of the *public realm*.

SS 8 Urban Heat Island Mitigation

The related credit encourages greenery and building setback that may enhance the quality of the *public realm*.

3 Sustainable Site**3.1 Neighbourhood Integration****SS 4 Neighbourhood Daylight Access**

Extent of Application	All buildings
Objective	Encourage building development which is sensitive to the needs of neighbours in respect of preserving daylight and views.
Credits Attainable	1
Credit Requirement	1 credit for designs for which the access to daylight of neighbouring sensitive buildings is maintained to the prescribed levels.
Assessment	<ol style="list-style-type: none"> 1. Demonstrate <u>either</u> by: <ol style="list-style-type: none"> 1.1 Computational lighting simulation / physical modelling, the Vertical Daylight Factors (VDFs) [1] on the facades of the lowest floors of the sensitive buildings most affected by the proposed development are either unchanged or are no less than 12%, or 1.2 Unobstructed Vision Area (UVA) Method [1], the UVAs of the windows on the lowest floors of the sensitive buildings most affected by the proposed development are unchanged (this method is only applicable for a project having no sensitive building within the <i>Site</i>) 2. For development located in an area where daylight is thought to be of no value to neighbouring properties, submit a scaled map covering the assessment area (see below sensitive building) to substantiate. 3. Submit a daylight access study report demonstrating compliance with the assessment criteria. The report should include: <ol style="list-style-type: none"> 3.1 Types and locations of sensitive buildings identified within the <i>Site</i> and in the vicinity on an A3-sized scale drawing; <u>For VDF simulation / physical modelling method:</u> A software validation report from the software developer should be provided to ensure the accuracy of simulation by the software. 3.2 Modelling assumptions; 3.3 Screen captures of project building, surrounding building and terrain of the 3D model; 3.4 Screen captures of the Sensitive Receivers' locations; <u>For UVA method:</u> 3.5 Scaled drawings showing the UVA at Sensitive Receivers before and after the proposed development; 4. The report should be endorsed by a locally qualified professional personnel who has at least 3 years of post-qualification experience in natural daylight study. <p>4.1 Sensitive Buildings</p> <ol style="list-style-type: none"> 4.1.1 Assessment area shall be 1H (H being the building height (m) of the tallest building on the project <i>site</i>) or 100m away from the project <i>site</i>, whichever is larger; 4.1.2 All sensitive buildings within the assessment area (excluding those within the <i>site</i>) shall be assessed to determine the value of daylight;

1 Buildings Department - PNAP APP-130 Lighting and Ventilation Requirements – Performance-based Approach. [ONLINE] Available at: <http://www.bd.gov.hk/english/documents/pnap/APP/APP130.pdf> [Accessed 5 July 2017]

- 4.1.3 Sensitive buildings include:
- 4.1.4 *Residential buildings;*
- 4.1.5 Premises that requires daylight to enhance the lighting environment for the occupants to perform tasks, such as offices and schools;
- 4.1.6 Premises that require daylight for energy saving and an improved environment for the transient stage of occupation, such as the circulation area of shopping centers and indoor games halls; and
- 4.1.7 Premises that require daylight primarily for view, such as hotels and hospitals.
- 4.1.8 Examples of premises that should be included: Commercial, education, shopping center, hall, church, temple, hotel, hostel, hospitals and shops
- 4.1.9 Temporary structures are not required to be modelled

4.2 Sensitive Receivers

- 4.2.1 Sensitive receivers should be placed at the glazing of the lowest floors of sensitive buildings within the assessment area.
5. The below requirements should be fulfilled in the daylight simulation:
- 5.1 Sky model should use CIE overcast sky (10,000 lux)
 - 5.2 Overall external reflectance of an average of 0.2 for building (include the project development, unless provide other supporting) and 0.2 for ground
 - 5.3 Surrounding buildings and terrain shall be included in the model based on the GIS information from Lands Department.
 - 5.4 The surrounding building and large structures should be included in the simulation model. The surrounding area should be at least 2H (H being the building height (m) of the tallest building on the project *site*) or 200m away from the project *site* boundary, whichever is larger. The building geometry can be simplified as blocks.
 - 5.5 The terrain area shall be in a size of at least, 10H (H being the building height (m) of the tallest building on the project *site*) or 1000m × 1000m, whichever is larger, with the project placed in the centre. Where smaller terrain area is desired, the applicant should propose a terrain area with justification and the terrain area should be surrounded by a wall with a height of the average height of the surrounding buildings.

3 Sustainable Site**3.1 Neighbourhood Integration****SS 5 Noise Control for Building Equipment**

Extent of Application	All buildings.
Objective	Encourage proactive design techniques intended to reduce the nuisance caused to neighbours by noise from building services equipment.
Credits Attainable	1
Credit Requirement	1 credit for demonstrating that the level of the intruding noise at the facade of potential noise sensitive receivers is in compliance with the criteria recommended in the Technical Memorandum for the Assessment of Noise from Places Other than Domestic Premises, Public Places or Construction Sites [1].
Assessment	<ol style="list-style-type: none"> 1. Provide evidence in form of detailed analysis, appropriate calculations or measurements to demonstrate that the levels of the intruding noise at the facades of existing or potential noise sensitive receivers comply with the following assessment criteria: <ol style="list-style-type: none"> 1.1 Provide a background noise measurement report with detailed monitoring records to support the ANL requirements of day time and night time and background noise.. 1.2 On the basis of promoting good environmental design assessment, existing uses and land uses under statutory plans of Town Planning Ordinance should be examined to identify existing or potential noise sensitive developments. Where there is a piece of vacant land and no available information to verify its use, it should be assumed that it will become a noise sensitive receiver. 1.3 Ideally, assessment should be made at the facade on the noise sensitive receiver. Under circumstances that access to the noise sensitive development is not granted for measurement, calculation or a combination of measurement at a nearby location with calculation adjustment is permitted. 1.4 The noise assessments shall be conducted in accordance with the Technical Memorandum [2]. 1.5 Noise sensitive receivers should follow the Technical Memorandum. Only buildings external to the <i>site</i> boundary are assessed. 1.6 The major noise sources include chillers, water cooling towers, fans (duct type and centrifugal) and ducts [2]. Only equipment provided by the developer/owner is assessed. 1.7 All fixed noise sources should be located and designed so that when assessed in accordance with the Technical Memorandum, the level of the intruding noise at the facade of the nearest sensitive receiver should be at least 5 dB(A) below the appropriate ANL shown in Table 2 of the Technical Memorandum or, in the case of the background being 5 dB(A) lower than the ANL, should not be higher than the background, in accordance with paragraph 4.2.13, Chapter 9 of the Hong Kong Planning Standards and Guidelines [3]. Applicants are required to justify the selected Area Sensitivity Rating (ASR).

3 Sustainable Site 3.2 Ecologically Responsible Design

SS 6 Light Pollution Control

Extent of Application	All buildings.
Objective	Ensure that exterior lighting and building design do not create unwanted and unnecessary light pollution.
Credits Attainable	2
Credit Requirement	<p>(a) Control of obtrusive artificial light 1 credit for demonstrating that obtrusive light from exterior lighting meets the specified performance for the environmental zone in which the building development is located.</p> <p>(b) Control of external light reflection from building 1 credit for demonstrating that sunlight reflection from external surfaces of the buildings is controlled by using materials with acceptable external light reflectance.</p>
Assessment	<p>(a) Control of obtrusive artificial light</p> <ol style="list-style-type: none"> 1. Provide a scaled map showing the immediate neighbourhood of the <i>Site</i> highlighting the surrounding buildings included in the assessment. Only buildings outside the <i>site</i> boundary are assessed. 2. Provide a schedule of all exterior lighting fixtures, including their quantities, locations and model references and compile supplier information on the performance of the light fixtures used for modelling studies. 3. Provide exterior lighting layout plan showing types and locations of all exterior lighting fixtures. 4. Demonstrate that relevant recommendations in the HKSAR Government's Guidelines on Industry Best Practices for External Lighting are complied with [1]. 5. Meeting obtrusive light control requirements, using either the calculation method or backlight-uplight-glare (BUG) method when all installed luminaires' BUG rating information is available. If partial exterior luminaires are not BUG rated, hybrid approach (Calculation method & BUG method) could be used to show the credit compliance. <p>Calculation Method</p> <ol style="list-style-type: none"> 6. Demonstrate that the exterior lighting design complies within the maximum figure for each parameter (sky glow, light into windows, source intensity, and building luminance), taken from Table 1 and Table 2 in ILP Guidance Notes [2]. Provide justification of environmental zone, note that it is a district-scale consideration. 7. Prepare a light pollution calculation report for modelling studies to demonstrate compliance of the above criteria, including: <ol style="list-style-type: none"> 7.1 Assumptions adopted; 7.2 Screen capture of input parameters; 7.3 Screen capture of modelled buildings; 7.4 Results highlighting compliance of credit requirements.

1 Environment Bureau. Guidelines on Industry Best Practices for External Lighting. [ONLINE] Available at: http://www.enb.gov.hk/sites/default/files/en/node78/guidelines_ex_lighting_install_eng.pdf [Accessed 5 July 2017]

2 The Institution of Lighting Professionals. Guidance notes for the reduction of obtrusive light, GN01:2011 <https://www.theilp.org.uk/documents/obtrusive-light/>

BUG Method

- 8. Demonstrate that the specific light source installed in the luminaire do not exceed the luminaire upright, backlight and glare ratings, taken from IES TM-15-11 – Addendum A[3], based on mounting location and distance from the property line (assessment boundary). Provide justification of Model Lighting Ordinance (MLO)[4] lighting zone, note that it is a district-scale consideration,
- 9. Define assessment boundary on layout
- 10. BUG values are typically published by product manufacturers. If published BUG data do not address the design position of the luminaire (or are not available at all), ratings can be calculated by reviewing a luminaire’s photometric test data and zonal lumen distribution and comparing the data with maximum zonal lumens for backlight, upright, and glare established in IES TM-15-11, Addendum A. Software calculation for BUG rating is acceptable to reflect the compliance.
- 11. Prepare a BUG method report to demonstrate compliance of the above criteria, including:
 - 11.1 Highlighting manufacturer BUG rating information for installed luminaires
 - 11.2 Software calculation (if applicable) for the BUG rating with all assumption adopted, screen capture of input parameters and results of BUG rating.

Hybrid Method

- 12. Assessment requirements combined Calculation Method and BUG Method.
- * Exemptions from this credit assessment
- 13. The following exterior lighting is exempted from the requirements, provided it is controlled separately from the non-exempt lighting:
 - 13.1 Specialized signal, directional, and marker lighting for transportation
 - 13.2 Lighting for theatrical purposes for stage, film, and video performances
 - 13.3 Hospital emergency departments, including associated helipads

(b) Control of external light reflection from building

- 1. Demonstrate objectively that sunlight reflection from external surfaces of the building development is properly controlled and meets the following requirements:

External surfaces of various parts of the building development	Total	Specular
	External Light reflectance not to exceed	
Glass	20%	Nil
At least 50% (measured by surface areas) of materials (other than glass) on building facades and roof	Nil	10%

Note:

- (i) Specular reflectance is the type of reflectance when light is reflected away from the reflecting surface at the same angle as it is incident.

3 Backlight, Uplight, and Glare (BUG) Ratings - IES TM-15-11 – Addendum A

4 Illuminating Engineering Society and International Dark-Sky Association (IES/ IDA) Model Lighting Ordinance User Guides
http://darksky.org/wp-content/uploads/bsk-pdf-manager/16_MLO_FINAL_JUNE2011.PDF

(ii) Total external light reflectance is the sum of specular and diffuse reflectances.

2. The testing of reflectance values for any material shall be conducted by accredited laboratories in accordance with ASTM E903: Standard Test Method for Solar Absorptance, Reflectance, and Transmittance of Materials Using Integrating Spheres, or equivalent, with an integrating sphere of minimum 150mm diameter.

3 Sustainable Site**3.2 Ecologically Responsible Design****SS 7 Ecological Preservation/ Enhancement**

Extent of Application	All buildings except <i>brownfield sites</i> or <i>sites</i> on reclaimed land for SS 7a. <i>Sites</i> with adjacent areas of medium or high ecological value for SS 7b. <i>Sites</i> with existing trees preserved for SS 7c.
Objective	Preserve and/ or enhance the ecological value of the <i>site</i> in terms of habitat and biodiversity.
Credits Attainable	1 + 4 BONUS
Credit Requirement	<p>(a) Preservation and/ or enhancement of ecological impact 1 credit for demonstrating that ecological values of the <i>Site</i> are preserved where existing habitat types of medium or high ecological values are identified on the <i>Site</i>. Alternatively, 1 credit for demonstrating that ecological values of the <i>Site</i> are enhanced where existing habitat types of medium ecological values are identified on the <i>Site</i>. Alternatively, 1 credit for demonstrating that ecological values of all identified existing habitat types on the <i>Site</i> are low and habitat types of medium ecological values are introduced on the <i>Site</i>. 1 additional BONUS credit for demonstrating that ecological values of all identified existing habitat types on the <i>Site</i> are low and habitat types of high ecological values are introduced on the <i>Site</i>.</p> <p>(b) Interconnectivity with adjacent areas of ecological value 1 BONUS credit for providing physical interconnectivity between any existing/ new areas of ecological value within the <i>Site</i> and any adjacent areas of medium or high ecological value. The total combined total area of eligible interconnected areas represents not less than 5% of the total <i>Site</i> Area.</p> <p>(c) Tree retention 1 BONUS credit for demonstrating that existing trees are retained in situ such that the combined girth of the retained trees, with individual girth of at least 150mm, is at least 20% of the total girth of all existing trees on <i>site</i>. For exemplary performance, ADDITIONAL BONUS credit where 40% or more of the total girth of all existing trees are retained on <i>site</i>.</p>
Assessment	<p>(a) Preservation and/ or enhancement of ecological impact 1. Provide an ecological mapping of the <i>Site</i> to identify the locations, dimensions and areas of all existing habitat types within the <i>Site</i> and their ecological conditions to determine their corresponding ecological value. The mapping of habitat types, their definition and ecological value identification shall make reference to Terrestrial Habitat Mapping and Ranking Based on Conservation Value introduced by the HKSAR Government [1]. Types of habitats and their ecological values are summarised below:</p>

1 Sustainable Development Unit, Environment Bureau. Terrestrial Habitat Mapping and Ranking Based on Conservation Value. [ONLINE] Available at: http://www.epd.gov.hk/epd/english/environmentinhk/eia_planning/sea/terresthab.html [Accessed 5 July 2017]

Ecological Value	Habitat Types
High Value	Fung Shui Forest; Montane Forest; Lowland Forest; Mixed Shrubland; Freshwater/ Backish Wetland; Natural Watercourse; Seagrass Bed; and Intertidal Mudflat.
Medium Value	Shrubby Grassland (including Baeckea Shrubland) Plantation or Plantation/ Mixed Forest; Fishpond/ Gei Wai; Sandy Shore; Rocky Shore; and Cultivation.
Low Value	Bare Rock or Soil; Grassland; Modified Watercourse; Artificial Rocky/ Hard Shoreline; Golf Course/ Urban Park; and Quarry
Negligible Value	Rural industrial storage/ containers; Landfill; and Others.

2. Provide a report to demonstrate one of the following is achieved:
 - 2.1 Ecological values of the *Site* are preserved where existing habitat types of medium or high ecological values are identified on the *Site*,
 - 2.2 Ecological values of the *Site* are enhanced where existing habitat types of medium ecological values are identified on the *Site*,
 - 2.3 Ecological values of all identified existing habitat types on the *Site* are either negligible or low, or
 - 2.4 Ecological values of all identified existing habitat types on the *Site* are either negligible or low and habitat types of medium or high ecological values are introduced on the *Site*.
3. For a project preserving or enhancing the ecological values of the *Site*, demonstrate that ecological design strategies adopted are based on accepted ecological principles with defined goals:
 - 3.1 Conclude action plan on which existing habitats deserve better protection and establish priority.
 - 3.2 Demonstrate that the landscape works of the development is conducive to creating habitats for wildlife and supporting a viable local ecosystem by reference to leading literature regarding the interrelationship between the proposed plant species and insects, birds and fauna of conservation interest.
 - 3.3 Propose on-site tree replacement and recreated habitats when existing trees and natural habitats are removed from the *Site*. Types of new or restored habitats and their design proposals, including buffer zone for protection from human activities shall be assessed.

(b) Interconnectivity with adjacent areas of ecological value

1. Provide an ecological mapping of the areas immediately adjacent to the *Site* to identify all existing habitat types in the vicinity of the *Site* and their ecological conditions to determine their corresponding ecological value. The mapping of habitat types, their definition and

- ecological value identification shall make reference to Terrestrial Habitat Mapping and Ranking Based on Conservation Value [1].
2. Demonstrate physical interconnectivity between any existing/ new areas of ecological value within the *Site* and any adjacent areas of medium or high ecological value.
 3. Demonstrate the physical interconnectivity is contiguous through open soft landscape areas that are not less than 5m wide and are not broken by occasional footpaths, other installations or features wider than 5m.
 4. Demonstrate by accepted ecological principles with defined goals how the design, on-going landscape management and maintenance aspects will create habitats for wildlife and support a viable local ecosystem by reference to leading literature regarding the interrelationship between the proposed plant species and insects, birds and fauna of conservation interest.

(c) Tree retention

1. Include a detailed tree survey of all trees on *Site* in accordance with the Technical Circular No. 7/2015 of Development Bureau of the HKSAR Government.
2. Demonstrate the girth of retained trees shall be at least 20% of the total girth of all existing trees on *site*.
 - 2.1 The retained trees counting towards the 20% girth shall each have a girth of not less than 150 mm and shall each have no more than 25% of its crown pruned to enable construction and operation of the Project.
 - 2.2 Trees transplanted within the *site* do not qualify as retained trees for this BONUS credit.

(b) Related Credits

SS P1 Minimum Landscaping Requirements

The related prerequisite requires minimum *site* coverage of greenery and minimum provisions for viability of planting, for example, the minimum soil volumes and depths for all plant areas.

SS 1 Pedestrian-oriented and Low Carbon Transport

The related credit encourages the shading of main pedestrian paths by trees. The soil space of trees shall meet the minimum standards stipulated in SA P1.

SS 8 Urban Heat Island Mitigation

The related credit encourages higher overall *site* coverage of greenery.

SS 10 Outdoor Thermal Comfort

The related credit considers the positive effect of shading by trees and the surrounding ground surface temperatures of greenery within the *site*.

SS 11 Stormwater Management

The related credit considers softscape provided with the *site* for infiltration and detention in stormwater management.

WU 2 Water Efficient Irrigation

The related credit considers water efficient irrigation for greenery provided within the *site*.

HWB 2 *Biophilic Design*

The related credit encourages human-nature connection for building occupants.

BETA 0

3 Sustainable Site 3.3 Bioclimatic Design

SS 8 Urban Heat Island Mitigation

Extent of Application	of All Buildings
Objective	Encourage building design to adopt measures to mitigate urban heat effect.
Credits Attainable	For <i>Site</i> area < 1000m ² : 1 For <i>Site</i> area ≥ 1000m ² : 4 + 4 BONUS
Credit Requirement	<p>For <i>Site</i> area <1000m²</p> <p>(a) Urban Design Guidelines Chapter 11 1 credit for implementing at least 2 <i>site</i> level strategies under Section 11 of Hong Kong Planning Standards and Guidelines Chapter 11 Urban Design Guidelines.</p> <p>For <i>Site</i> area ≥ 1000m²</p> <p>(a) Sustainable Building Design Measures</p> <ul style="list-style-type: none"> (i) 1 credit for providing shade on at least 5% of the <i>site</i> area and at least 50% of non-roof impervious surfaces on the <i>site</i> (parking, walkways, plazas) using light coloured high-<i>albedo</i> materials (<i>albedo</i> of at least 0.4). (ii) 1 credit for demonstrating compliance with prescribed requirements of the SBD Guidelines as promulgated in the PNAP APP-152. (iii) 1 additional BONUS credit for demonstrating compliance with prescribed requirements and relevant prescriptive requirements of the SBD Guidelines as promulgated in the PNAP APP-152 with enhanced performances. <p>(b) Tree Coverage 1 BONUS credit for demonstrating that at least 10% of the total <i>Site</i> Area is provided with tree coverage. For exemplary performance, ADDITIONAL BONUS credit where 20% or more of the <i>site</i> is provided with tree coverage.</p> <p>(c) Air Ventilation Assessment (AVA) For conducting an AVA by <i>wind tunnel</i> or <i>Computer Fluid Dynamics (CFD)</i> according to the prevailing AVA methodology introduced by the Government demonstrating that better or equivalent ventilation performances than a baseline case: 1 Credit for demonstrating annual wind condition 1 Credit for demonstrating summer wind condition.</p> <p>(d) Intra Urban Heat Island Study 1 BONUS credit for conducting an Intra Urban Heat Island Study demonstrating that a maximum <i>Intra-Urban Heat Index</i> (difference between T_{urban} and T_{met}) in summer is less than 0.8 °C.</p>
Assessment	<ol style="list-style-type: none"> 1. For <i>Site</i> area <1000m² <ol style="list-style-type: none"> 1.1 Demonstrate the <i>site</i> planning comply with 2 strategies under Section 11 of Hong Kong Planning Standards and Guidelines Chapter 11 Urban Design Guidelines with: 1.2 Mark up on layout plan for the implemented strategies 1.3 Description on the implemented strategies 2. For <i>Site</i> area ≥ 1000m² <p>(a) Sustainable Building Design Measures</p>

2.1 Non-roof Impervious Surfaces Requirements

Demonstrate that shade is provided on at least 5% of the *site* area and at least 50% of non-roof impervious surfaces on the *site* (parking, walkways, plazas) using light coloured high-*albedo* materials (*albedo* of at least 0.4). (Podium roof no matter whether it is accessible or not will not be counted as non-roof surfaces).

2.2 Sustainable Building Design (SBD) Guidelines Requirements

Provide evidences in the form of scaled drawings and calculations to demonstrate compliance with relevant prescriptive requirements of the SBD Guidelines as promulgated in the PNAP APP-152 [1].

Roof materials with *Solar Reflectance Index (SRI)* of 78 or above will be acceptable an alternative to vegetated roof.

Provide a summary of overall *site* coverage of greenery (method of measurement and calculation of *site* coverage of greenery except otherwise stated below shall be in accordance with Buildings Department PNAP APP-152):

2.2.1 Covered greenery areas above the *primary zone* (measured from 45° projected line taken from the edge of building) in communal areas accessible to public, occupiers or visitors shall be counted (50% reduction factor applies).

2.2.2 Planters along the perimeter of an inaccessible roof above the *primary zone* but within 15m vertical zone from communal areas accessible to public, occupiers or visitors shall be counted (50% reduction factor applies).

2.2.3 Vertical greening within 15m vertical zone from communal areas accessible to public, occupiers or visitors shall be counted (no reduction factor applies but vertical frames with a height more than 7.5m are not accountable for vertical greening provided by climbing or weeping plants).

2.3 Enhanced Performances of Sustainable Building Design Guidelines

Further to requirements stated in SS 8a(ii), provide evidence demonstrate compliance with the followings:

2.3.1 Sustainable Soft Landscape Requirements

Provide the landscape plans for the *site* and detail the landscape treatment of the development including the planting and hard finishes of all landscaped areas, slopes and retaining structures, showing:

- a) Planting plans with the character and planting densities for all softworks elements;
- b) Tree planting locations;
- c) Details of the species;
- d) Live load calculation of roof (if planting is provided on the roof), and
- e) Maintenance plan for the greenery.

Demonstrate how soft landscaping has addressed the guidelines and recommendations provided in the Hong Kong Planning Standards and Guidelines Chapter 4 Section 2 Greenery, appropriate to the type and scale of the building development and the immediate surroundings.

Demonstrate that at least 50% of the plant species used for trees, shrubs and grass/ ground covers respectively in terms of quantities are drought-tolerant to minimise watering requirements.

Demonstrate that the species, density and topsoil comply

with the General Specification for Building Section 25: Landscape, or at least equal equivalent.

2.4 Minimum Separating Distance and Permeability:

Height (H) of the tallest building	Minimum P of buildings in each assessment zone on two projection planes			
	Site area < 20,000m ² and with Lp < 60m	Site area < 20,000m ² and with Lp ≥ 60m	Site area ≥ 20,000m ²	
	Each Plane	Each Plane	Plane 1	Plane 2
H ≤ 60m	20%	25%	25%	30%
H > 60m	20%	25%	25%	40%

2.5 Minimum Site Coverage of Greenery:

Site Area	Site Coverage of Greenery	
	Primary zone	Overall
< 20,000 m ²	12.5%	30%
≥ 20,000 m ²	17.5%	40%

(b) Tree Coverage

1. Submit plan drawing or calculation for tree coverage showing the estimated crown spread 10 years after the landscape installation:
2. Tree coverage is defined as the combined plan area under all tree canopies, projected perpendicularly onto the ground/ floor surface, within the *Site*, where tree canopies are drawn at their estimated spread 10 years after the landscape installation.
3. Evidences for tree diameters prediction shall be provided with reference to examples of existing trees of that species planted in similar conditions in Hong Kong. In order not to overestimate tree crown diameter, the largest dimension permitted in the calculation shall be 12m in diameter for large wide spreading trees.
4. EVA shall be excluded from the total *site* area for the purpose of tree coverage calculation.

(c) Air Ventilation Assessment (AVA)

1. Between *site velocity ratio (SVR)* or *local velocity ratio (LVR)*, show that one of these two ratios increases or remain the same in the optimal option compared to the base case, while the other ratio is not reduced.
2. The annual wind rose (wind probability table) at 400 – 600m of the *site* should be used. The annual or summer prevailing wind used in the simulation should have an accumulated percentage occurrence of 75% (accumulation starts in the order from the highest occurrence to the lowest). The baseline scheme should meet Design Requirements (1) and (2) of Building Separation under the SBD Guidelines.
3. Demonstrate credit compliance by following one of the below routes:

Compliance route 1: CFD Simulation

4. Submit an *air ventilation assessment* report. The report shall also include simulation assumptions and screen capture of project building, surrounding building and terrain of the 3D model.
5. The *site velocity ratio (SVR)* and *local velocity ratio (LVR)* of all test points should be reported.
6. The modelling methodology should adopt prevailing AVA methodology introduced by the government [2], unless specified below.
7. A software validation report from the software developer should be provided to ensure the accuracy of simulation by the software.
8. The below requirements should be fulfilled in the CFD simulation:

- 8.1 Surrounding buildings and terrain shall be included in the model based on the GIS information from Lands Department, the Government of HKSAR.
- 8.2 The surrounding area shall be at least, 2H (H being the building height (m) of the tallest building on the project *site*) or 200m away from the project *site* boundary, whichever is larger
- 8.3 The terrain area shall be in a size of at least, 10H (H being the building height (m) of the tallest building on the project *site*) or 1000m × 1000m, whichever is larger, with the project placed in the centre.
- 8.4 For practical reasons, the geometry can be simplified to block.
9. Wind data, such as wind frequency, wind rose, wind profile should be adopted from the appropriate and reliable sources, such as simulated *site* wind data based on appropriate mathematical models, such as RAMS from PlanD [3] or experimental *site* wind data from *wind tunnel* test.
10. If wind profile is not provided from the above sources, applicant can refine the ground roughness and model the wind profile using power law or log law for each wind direction, based on:

$$\text{Power Law } \left(\frac{U_z}{U_g}\right) = \left(\frac{Z_z}{Z_g}\right)^\alpha \quad \text{Log Law } U_z = \frac{u^*}{\sigma} \ln\left(\frac{Z}{Z_0}\right)$$

- U_z Wind speed at height z from ground
 U_g wind speed at reference height (top of wind boundary layer)
 Z_z height z from ground
 Z_g reference height (top of the wind boundary layer)
 α power law exponent
 σ von Karman constant = 0.4
 Z_0 roughness length
 u^* friction velocity
 Z height z from ground, same as Z_z in power law

Terrain crossed by approaching wind	A	Z _G	Z ₀
Sea and open space	≈ 0.15	≈ 300	≈ 0.1
Suburban or mid-rise	≈ 0.35	≈ 400	≈ 1
City centre or high-rise	≈ 0.50	≈ 500	≈ 3

11. These coefficients serve as reference only [4]. Applicants should justify the suitability of coefficients for the project.
12. Detailed Study shall be carried out if it is required under the Technical Circular No. 1/06 of Housing, Planning and Lands Bureau (HPLB) and Environment, Transport and Works Bureau (ETWB). The Detailed Study can be carried out by *wind tunnel* test or CFD under all 16 prevailing wind conditions.
13. The simulation report should be endorsed by a Chartered Engineer with 3 years of post-qualification experience in CFD simulation.

Compliance route 2: Wind Tunnel Test

14. Demonstrate compliance by submitting a *wind tunnel* test report.
15. The technical standards pertaining to the execution of the current boundary layer *wind tunnel* studies conform to the guidelines outlined within the Hong Kong Wind Loading Code and are fully in-line with the guidelines of the *Air Ventilation Assessment* Technical Circular No. 1/06 for developments in Hong Kong.

3 RAMS wind data. [ONLINE] Available at:
http://www.pland.gov.hk/pland_en/info_serv/site_wind/site_wind/index.html [Accessed 5 July 2017]

4 Feasibility Study for Establishment of *Air Ventilation Assessment* System Final Report, Department of Architecture, Chinese University of Hong Kong, Nov 2005

16. The *wind tunnel* facilities should comply with the requirements of internationally recognised guides such as the guidelines of the American Society of Civil Engineers (ASCE) Manual of Practice No.67 for *Wind Tunnel Studies* and the Quality Assurance Manual, AWES-QAM-1-2001 by the Australasian Wind Engineering Society (AWES).
17. The wind profile can be created by the Power Law or the Log Law with appropriate coefficients.

Test Point Locations and Focus Areas for Both Routes

18. The assessment area shall be at least, 1H (H being the building height (m) of the tallest building on the project *site*) or 100m away from the project *site* boundary, whichever is larger.
19. Test point shall be placed 2m above pedestrian level within the assessment area.
20. Perimeter test points are positioned on the project *site* boundary. Typically about 30 perimeter test points well-spaced out and located will suffice.
21. Overall test points are evenly distributed and positioned in the open spaces, on the streets where pedestrians frequently access. For areas that are not open to the public can be exempted. For practical reasons, around 50 test points may be adequate for typical development *sites*.

(d) Intra Urban Heat Island Study

1. Provide an Intra-urban Heat Island Study report demonstrating that a maximum *Intra-Urban Heat Index* (difference between T_{urban} and T_{met}) in summer is less than 0.8 °C through Urban Heat Island Intensity calculation.
2. Temperature calculation shall be carried out for 10 consecutive days, the 10th day temperature profile between 08:00 to 18:00 hours shall be used for current assessment
3. The calculation should use the maximum temperature difference of T_{urban} and T_{met} between 08:00 to 18:00 hours to represent the Intra Urban Heat Index for the *Site*, where

$$\text{Intra Urban Heat Index} = \text{Max} [T(t)_{\text{urban}} - T(t)_{\text{met}}] < 0.8$$

$$T(t)_{\text{urban}} = \text{the predicting urban air temperature at the Site}$$

$$T(t)_{\text{met}} = \text{the meteorological air temperature}$$
4. In the report, provide a brief summary of the adopted methodology to calculate the *Intra-Urban Heat Index*.
5. Assess an individual *Intra-Urban Heat Index* within the *Site* and report under appropriate area breakdown with the maximum area of 10 ha.
6. The Intra-Urban Heat Island effect of a project is the contribution to the energy balance at a certain time, which can be quantified by *Intra-Urban Heat Index*. The *Intra-Urban Heat Index* here shall be defined by the maximum temperature difference of $T(t)_{\text{urban}}$ and $T(t)_{\text{met}}$ in the corresponding hour between 08:00 to 18:00 hours on a typical summer day. The detailed calculation methodology shall be referring to relevant literature [5,6,7 and 8].
7. In order to capture Intra-Urban Heat Island effect of the Project precisely, the proposed methodology shall address the air temperature changes due to the Intra-Urban Heat Island Effect.
8. The report shall contain detailed considerations of the factors listed below, as a minimum:
 - 8.1 Radiation heat gain/ loss from/ to the environment;

5 Santamouris M. 2001, 'On the impact of urban climate on the energy consumption of buildings', Solar Energy, vol. 70, pp. 201-216.

6 Oke TR. 1988, 'The urban energy balance', Progress in Physical Geography, vol.12, pp. 471-508.

7 Shashua-Bar, L. Hoffman, M. E. 2002, 'The Green CTTC model for predicting the air temperature in small urban wooded sites', Building and Environment, vol. 37, pp. 1279 -1288.

8 Elnahas, M. M., Willimanson, T. J. 1997, 'An improvement of the CTTC model for predicting urban air temperatures', Energy and Building, vol. 25, pp. 41-49.

- 8.1.1 Direct and diffused solar radiation on surface;
- 8.1.2 Shading effect from buildings/ trees;
- 8.1.3 Radiant heat loss from urban fabric to the surrounding; and
- 8.1.4 Effect of Absorptivity/ Emissivity of surfaces;
- 8.2 Thermal storage effect of urban fabric;
 - 8.2.1 Thermal capacity in participating ground layer, building and tree surface etc.;
- 8.3 Wind environment;
 - 8.3.1 Convective heat transfer within urban cluster;
 - 8.3.2 Computational Fluid Dynamics (CFD) technique shall be used to assess the ventilation of the Project (refer to section below);
- 8.4 Evaporative heat transfer;
 - 8.4.1 Greenery evapotranspiration;
 - 8.4.2 Evaporative heat transfer from water features; and
 - 8.4.3 Evaporative heat transfer from ground surface.
- 9. Calculation of $T(t)_{met}$ shall refer to reference environmental condition detailed in "Reference Environmental Conditions for *Intra-Urban Heat Index Calculation*" table.
- 10. The Applicant should use reference environmental condition in "Reference Environmental Conditions for *Intra-Urban Heat Index Calculation*" table except near ground wind velocity on Project Site to calculate $T(t)_{urban}$.
- 11. In order to calculate $T(t)_{urban}$, the wind environment of the Project shall be derived from Computational Fluid Dynamics (CFD) using *wind tunnel* data or RAMS data as stipulated in *Air Ventilation Assessment (AVA)* Technical Circular and Technical Guide [9].
- 12. Reference Environmental Conditions [10] for *Intra-Urban Heat Index Calculation*

(b) Related Credits

SS P1 Minimum Landscaping Requirements

The related prerequisite requires minimum *site* coverage of greenery and minimum provisions for viability of planting, for example, the minimum soil volumes and depths for all plant areas.

SS 1 Pedestrian-oriented and Low Carbon Transport

The related credit encourages the shading of main pedestrian paths by trees.

The soil space of trees shall meet the minimum standards stipulated in SS P1.

SS 7 Ecological Preservation/ Enhancement

The related credit encourages preservation/ enhancement of existing habitat within the *site*.

SS 10 Outdoor Thermal Comfort

The related credit considers the positive effect of shading by trees and the surrounding ground surface temperatures of greenery within the *site*.

SS 11 Stormwater Management

The related credit considers softscape provided with the *site* for infiltration and detention in stormwater management.

WU 2 Water Efficient Irrigation

The related credit considers water efficient irrigation for greenery provided within the *site*.

HWB 2 *Biophilic Design*

The related credit encourages human-nature connection for building occupants.

BETA 0

3 Sustainable Site**3.3 Bioclimatic design****SS 9 Immediate Neighbourhood Wind Environment**

Extent of Application All Buildings

Objective Ensure the wind environment around and adjacent to buildings has been adequately considered regarding wind amplification and, where appropriate, suitable mitigation measures are provided.

Credits Attainable 1

Credit Requirement 1 credit for demonstrating that no pedestrian areas will be subject to excessive wind velocities caused by amplification due to the *site* layout design and/or building design.

Assessment

1. Demonstrate that no test point reported exceeds a frequency weighted wind speed of 4m/s for the annual prevailing wind condition unless it is demonstrated that the excess of 4m/s is not caused by the proposed building.
2. The annual wind rose (wind probability table) at 400 – 600m of the *site* should be used. The annual prevailing wind used in the simulation should have an accumulated percentage occurrence of over 75% (accumulation starts in the order from the highest occurrence to the lowest).
3. Demonstrate credit compliance by following one of the below routes:

Compliance route 1: CFD Simulation

4. Submit a wind environment report. The report shall also include simulation assumptions and screen captures of the project building, surrounding buildings and terrain of the 3D model.
5. A software validation report from the software developer should be provided to ensure the accuracy of simulation by the software.
6. The below requirements should be fulfilled in the *CFD* simulation:
 - 6.1 Surrounding buildings and terrain shall be included in the model based on the GIS information from Lands Department, the Government of HKSAR.
 - 6.2 The surrounding area shall be at least, 2H (H being the building height (m) of the tallest building on the project *site*) or 200m away from the project *site* boundary, whichever is larger.
 - 6.3 The terrain area shall be in a size of at least, 10H (H being the building height (m) of the tallest building on the project *site*) or 1000m x 1000m, whichever is larger, with the project placed in the centre.
 - 6.4 For practical reasons, the geometry can be simplified to blocks.
7. Wind data, such as wind frequency, wind rose, wind profile should be adopted from appropriate and reliable sources, such as simulated *site* wind data based on appropriate mathematical models (e.g. RAMS from Planning Department, the Government of HKSAR [1]) or experimental *site* wind data from *wind tunnel* test.
8. If the wind profile is not provided from the above sources, applicant can refine the ground roughness and model the wind profile using power law or log law for each wind direction, based on:

$$\text{Power Law } \left(\frac{U_z}{U_g} \right) = \left(\frac{Z_z}{Z_g} \right)^\alpha \quad \text{Log Law } U_z = \frac{u^*}{\sigma} \ln \left(\frac{Z}{Z_0} \right)$$

1 RAMS wind data. [ONLINE] Available at:
http://www.pland.gov.hk/pland_en/info_serv/site_wind/site_wind/index.html [Accessed 5 July 2017]

U_z	Wind speed at height z from ground
U_G	wind speed at reference height (top of wind boundary layer)
Z_z	height z from ground
Z_G	reference height (top of the wind boundary layer)
α	power law exponent
σ	von Karman constant = 0.4
Z_0	roughness length
u^*	friction velocity
Z	height z from ground, same as Z_z in power law

Terrain crossed by approaching wind	α	Z_G	Z_0
Sea and open space	≈ 0.15	≈ 300	≈ 0.1
Suburban or mid-rise	≈ 0.35	≈ 400	≈ 1
City centre or high-rise	≈ 0.50	≈ 500	≈ 3

9. These coefficients serve as reference only [2]. Applicants should justify the suitability of coefficients for the project.
10. Detailed Study shall be carried out if it is required under the Technical Circular No. 1/06 of Housing, Planning and Lands Bureau (HPLB) and Environment, Transport and Works Bureau (ETWB). The Detailed Study can be carried out by *wind tunnel* test or *CFD* under all 16 prevailing wind conditions.
11. The simulation report should be endorsed by a Chartered Engineer with 3 years of post-qualification experience in *CFD* simulation.

Compliance route 2: Wind Tunnel Test

12. Demonstrate compliance by submitting a *wind tunnel* test report.
13. The technical standards pertaining to the execution of the current boundary layer *wind tunnel* studies conform to the guidelines outlined within the Hong Kong Wind Loading Code and are fully in-line with the guidelines of the *Air Ventilation Assessment* Technical Circular No. 1/06 for developments in Hong Kong.
14. The *wind tunnel* facilities should comply with the requirements of internationally recognised guides such as the guidelines of the American Society of Civil Engineers (ASCE) Manual of Practice No.67 for *Wind Tunnel* Studies and the Quality Assurance Manual, AWES-QAM-1-2001 by the Australasian Wind Engineering Society (AWES).
15. The wind profile can be created by the Power Law or the Log Law with appropriate coefficients.

Test Point Locations for Both Routes

16. The assessment area shall be at least, 1H (H being the building height (m) of the tallest building on the project *site*) or 100m away from the project *site* boundary, whichever is larger.
17. Test points shall be placed 2m above pedestrian level within the assessment area.
18. Perimeter test points are positioned on the project *site* boundary. Typically, about 30 perimeter test points which are well-spaced out and well located will suffice.
19. Overall test points are evenly distributed and positioned in the open spaces, on the streets where pedestrians frequently access. For areas that are not open to the public can be exempted. For practical reasons, around 50 test points may be adequate for typical development *sites*.
20. Additional test points shall be placed in outdoor recreational areas, open spaces and pedestrian paths within the project *site*.

None

3 Sustainable Site**3.3 Bioclimatic Design****SS 10 Outdoor Thermal Comfort**

Extent of Application	All <i>sites</i> with <i>site</i> area of 1,000 m ² or more.
Objective	Ensure adequate thermal comfort in outdoor environment within the <i>Site</i>
Credits Attainable	2
Credit Requirement	<p>(a) Shaded or covered routes 1 credit is awarded where at least one shaded or covered route, connects the <i>site</i> with nearby amenities/<i>site</i> main entrance/transport hub.</p> <p>(b) Passive open spaces with thermal comfort 1 credit is awarded where 50% or more of the passive open spaces and pedestrian zones achieve thermal comfort. This is demonstrated on a typical summer day at 3:00 pm in Hong Kong.</p>
Assessment	<p>(a) Shaded or covered routes</p> <ol style="list-style-type: none"> 1. Demonstrate at least one pedestrian route within the <i>site</i> from a notional building entry point to neighbourhood amenities/<i>site</i> main entrance/transport hub with shade or cover. The provision of shade or cover is confined to the <i>site</i> boundary. 2. The shape of shade or cover can be justified by daylight simulation software considering building self-shading and shading by exterior buildings and trees at the summer solstice at 9:00 am and 3:00 pm in Hong Kong. <p>(b) Passive open spaces with thermal comfort</p> <ol style="list-style-type: none"> 1. This credit applies to passive open space(s) [1] and pedestrian zone(s) within the <i>Site</i> Area. A pedestrian zone includes covered, but not enclosed areas such as covered walkways and covered sitting areas. 2. Submit an outdoor thermal comfort report demonstrating anticipated thermal comfort. The report should include the following: <ol style="list-style-type: none"> 2.1 Scale drawing(s) depicting the building disposition; and 2.2 Input data, picture of the 3D model, simulation assumptions 3. Relevant input data should be justified by applicants. 4. The report should be endorsed by a Hong Kong professional institute qualified engineer who has 5 years of experience in outdoor thermal comfort study. 5. The assessment should be based on the following approaches: <ol style="list-style-type: none"> 5.1 All passive open spaces and pedestrian routes, hereafter referred to as the Focus Areas, within the <i>Site</i> should be included in the assessment. A demarcation plan of the Focus Areas should be provided in the report 5.2 The climatic conditions of a typical summer day should make reference to the environmental conditions in Table "Reference Environmental Conditions" below, which are based on a 5-year average from 2009 to 2013 5.3 A brief summary of the selected thermal comfort calculation methodology, together with the selected method's recommended thermal comfort range, should be clearly stated in the report

1 Planning Department – Hong Kong Planning Standards and Guidelines Chapter 4 : Recreation, Open Space and Greening

6. Reference Environmental Conditions [2]

Time	Global Horizontal Irradiance, GHI (W/m ²)	Direct Normal Irradiance, DNI (W/m ²)	Diffuse Horizontal Irradiance, DHI (W/m ²)	Air Temp., T _a (°C)	Relative Humidity, RH (%)
3PM	525	340	254	31.0	72

7. Demonstrate credit compliance by following one of the below routes:

Compliance route 1: Thermal Sensation Index (TSI)

TSI [3] can be established using the following formula:

$$TSI = 1.7 + 0.1118 \times T_a + 0.0019 \times SR - 0.322 \times WS - 0.0073 \times RH + 0.0054 \times ST$$

Where,

T_a = air temperature (°C)

SR = horizontal solar radiation (W/m²)

WS = wind speed (m/s)

RH = relatively humidity (%)

ST = surrounding ground surface temperature (°C)

TSI should be based on the following:

- (i) Refer to reference environmental conditions shown in Table above, which outlines solar irradiation, air temperature, and relatively humidity to assess outdoor thermal comfort;
- (ii) Surrounding ground surface temperature (ST) of Air Temperature plus 3°C, (i.e. T_a + 3°C) should be used in the TSI equation.
- (iii) Wind environment of the Site shall use *Computational Fluid Dynamics (CFD)* technique to assess air velocity (m/s) of the Project. The methodology of using *CFD* in outdoor urban scale studies shall refer to *Air Ventilation Assessment (AVA) Technical Circular and Technical Guide* [4];
- (iv) Thermal comfort assessment shall consider the effect of shading from immediate surroundings, for example, trees, shading devices, self-shading from buildings; and
- (v) The calculations should be based on an area breakdown in the range between 1m² and 100m².

Where it is demonstrated that 50% or more of the passive open spaces and pedestrian zones, in terms of area, have achieved thermally acceptable range on a typical summer day at 3:00 pm, the credit will be awarded.

TSI	Thermal Sensation	
1	Cold	Too cold
2	Slightly Cold	
3	Acceptably cool	Thermally acceptable range
4	Neutral	
5	Acceptably warm	
6	Slightly Hot	Too hot
7	Hot	

Compliance route 2: Physiological Equivalent Temperature (PET)

2 HKO (Averaged data from 2009 to 2013)

3 Givoni, B., M. Noguchi, H. Saaroni, O. Pocher, Y., Yaacov, N. Feller and S. Becker 2003, *Outdoor comfort research issues*, Energy and Buildings vol. 33, pp. 77-86.

4 Housing, Planning and Lands Bureau, and Environment, Transport and Works Bureau 2006, Technical Circular No. 1/06: *air ventilation assessments*

PET [5] should be used to assess the outdoor thermal comfort. Mean radiant temperature, T_r (Air Temperature plus 3°C, (i.e. $T_a + 3^\circ\text{C}$) shall be used.

Thermal Perception	TPC for subtropical region	Range of thermal comfort
Very cold	< 14	Too cold
Cold	≥ 14 to < 18	
Cool	≥ 18 to < 22	
Slightly cool	≥ 22 to < 36	Range of thermal comfort
Neutral	≥ 26 to < 30	
Slightly warm	≥ 30 to < 34	
Warm	≥ 34 to < 38	Too hot
Hot	≥ 38 to < 42	
Very hot	≥ 42	

Where it is demonstrated that 50% or more of the passive open spaces and pedestrian zones, in terms of area, have achieved the range of thermal comfort on a typical summer day at 3:00 pm, the credit will be awarded.

8. Alternative route

8.1 The study may elect any widely accepted methodology to demonstrate that the thermal comfort is in accordance with the credit requirement.

8.2 Should any method other than the Thermal Sensation Index (TSI) or Thermal Physiological Equivalent Temperature (PET) be chosen to demonstrate thermal comfort in outdoor spaces (e.g. or equivalent indicator / index for thermal comfort level), supplementary information on methodology, calculation and / or simulation results should be supplied. The onus is placed on the Client to demonstrate the appropriateness of the chosen methodology and relevant precedent(s) where the elected methodology was used, and accepted by professionals in the field.

3 Sustainable Site**3.4 Climate Resilience and Adaptability****SS 11 Stormwater Management**

Extent of Application	All <i>sites</i> with <i>site</i> area of 1,000 m ² or more.
Objective	Encourage a high standard of stormwater management to reduce risk of flooding and to promote groundwater recharge.
Credits Attainable	1 + 1 BONUS
Credit Requirement	<p>1 credit for demonstrating that adequate stormwater management design measures have been provided to manage the total volume of runoff corresponding to a design rainfall of at least 30mm/day for the <i>site</i> in its post-developed conditions.</p> <p>1 additional BONUS credit for demonstrating that adequate stormwater management measures have been provided to manage the total volume of runoff corresponding to a design rainfall of at least 40mm/day for the <i>site</i> in its post-developed conditions.</p>
Assessment	<p>1. Calculate the stormwater detention storage volume on <i>site</i> required to manage runoff using the following formula:</p> $V = 10 \times H \times \sum \phi \times A / 10000$ <p>V: Stormwater storage volume on <i>site</i> required (in m³) H: Daily total rainfall intensity (30mm or 40mm for the credit/ bonus respectively) ϕ: <i>Runoff coefficients</i> of various surfaces/ substrates (please refer to the following table) A: Areas of various surfaces/ substrates (in m²)</p>

Surfaces/ substrates	Runoff coefficients
Water bodies	1
Flat roof/ road/ hardscape with impervious construction	0.85
Flat roof covered with pebbles	0.65
Green roof (soil depth of at least 300mm)	0.35
Earth-covered (soil depth not more than 500mm) basement	0.35
Pervious paving and construction (maximum slope of porous pavement surface to a gradient of 1:20; the minimum <i>permeability coefficient</i> under 15°C for permeable paving / construction	0.25

should be 1.0 x 10 ⁻² cm/s)	
At-grade softscape	0.15
Earth-covered (soil depth more than 500mm) basement	0.15

Note:

- 1) The above information has made reference to the design guides for stormwater management/runoff control GB50014 and DB11/685 of PRC.
 - 2) Alternative *runoff coefficients* may be proposed and justified by applicants subject to approval.
2. Calculate the stormwater detention storage volume provided by various stormwater management measures such as detention tanks, sunken plaza/ wet ponds/ reservoirs, *bioretention facilities*, rainwater storage cisterns/modules, etc.
 3. Demonstrate adequate stormwater management measures to meet the credit requirements have been provided by a stormwater management report with a summary of volume/ area calculations, layout drawings and photographic records.

SS P1 Minimum Landscaping Requirements

The related prerequisite requires minimum *site* coverage of greenery and minimum provisions for viability of planting, for example, the minimum soil volumes and depths for all plant areas.

SS 1 Pedestrian-oriented and Low Carbon Transport

The related credit encourages the shading of main pedestrian paths by trees. The soil space of trees shall meet the minimum standards stipulated in SS P1.

SS 7 Ecological Preservation/ Enhancement

The related credit encourages preservation/enhancement of existing habitat within the *site*.

SS 10 Outdoor Thermal Comfort

The related credit considers the positive effect of shading by trees and the surrounding ground surface temperatures of greenery within the *site*.

WU 8 Water Harvesting and Recycling

The related credit considers harvesting of rainwater provided within the *site*.

HWB 2 *Biophilic Design*

The related credit encourages human-nature connection for building occupants.

3 Sustainable Site**3.4 Climate Resilience and Adaptability****SS 12 Design for Climate Change Adaptation**

Extent of Application	All buildings
Objective	Encourage reviewing the impact of projected climate change scenarios on the development and consider strategies to improve climate resilience.
Credits Attainable	1 BONUS
Credit Requirement	1 BONUS for studying the projected variation in temperature and rainfall and water level rise/storm surge of adjacent water bodies due to climate change and its impact on the development, and prepare mitigation proposal to improve the climate resilience of the building.
Assessment	<ol style="list-style-type: none"> 1. Refer to the projected annual rainfall and changes in annual temperature under the medium-low scenario (mean value) [1] and water level rise/ storm surge of adjacent water bodies , suggest 3 negative issues caused by the projected variations which will have impacts on the building such as its structure, facade, outdoor area or building services system. 2. Prepare a climate resilience proposal including at least 1 strategy for each of the above mentioned negative issue. The strategies should be supported by preliminary design, estimation of material costs and expected outcome on resolving the respective negative issue. If necessary, assume a building life cycle of 50 years. The effectiveness of the proposed strategies should be demonstrated by preliminary calculations where justifiable assumptions and simplifications should be stated. No detailed simulations are required in this credit. 3. Note that no obligation is required to implement the proposal. 4. Relevant measures that have been implemented in the design in other credits may be included to demonstrate compliance for this credit.

4	Materials and Waste	4.P Prerequisite 4.1 Efficient Use of Materials 4.2 Selection of Materials 4.3 Waste Reduction
	Introduction	<p>The amount and range of materials used in construction, operation and maintenance and fitting-out of buildings represents a significant use of natural resources, in terms of extracted raw materials, emissions, and <i>embodied energy</i>. There are opportunities to reduce environmental impacts through improved design, choice of materials, and installation methods. Of concern are:</p> <ul style="list-style-type: none"> • pollutants arising from manufacturing, transportation and operation; and • waste generated and recycled <p>There are opportunities to reduce material use through modular designs allowing off-site prefabrication, lean construction methods, etc.; and to reduce waste from a life cycle perspective, including provisions of appropriately designed waste facilities for waste recycling / recovery / <i>reuse</i>.</p>
4.P	Prerequisite	MW P1 Minimum Waste Handling Facilities
	Background	This part is to set out the minimum requirement for materials aspects in terms of provision of waste handling facilities.
4.1	Efficient Use of Materials	MW 1 Building Re-use MW 2 Modular and Standardised Design MW 3 Prefabrication MW 4 Design for Durability and Resilience
	Background	Efficiency in the use of materials can be significantly improved through <i>reuse</i> of building elements, such as foundations, main structures, facades, etc. Flexibility in design allows for change in use of layout of the premises within a building development. High standards of design detailing permits off-site prefabrication of major building components, allows for deconstruction, and improves durability and longevity of buildings.
4.2	Selection of Materials	MW 5 Sustainable Forest Products MW 6 Recycled Materials MW 7 Ozone Depleting Substances MW 8 Regional Materials MW 9 Use of Green Products MW 10 Life Cycle Assessment
	Background	The selection of materials that are environmentally sustainable, have significant recycled content, or otherwise have relatively low environmental impacts and result in lower <i>embodied energy</i> , should be considered at the earliest stages of planning and design of building developments, and carried over to fit-out and subsequent redecoration.
4.3	Waste Reduction	MW 11 Adaptability and Deconstruction MW 12 Enhanced Waste Handling Facilities
	Background	<p>Designs that allow users flexibility in the layout of premises and designs that allow for dismantling during deconstruction can significantly reduce consumption of resources and generation of waste.</p> <p>Well-managed facilities for the recycling of solid waste encourage recycling and results in reductions in the disposal at landfill <i>sites</i>. Buildings should be designed with the provision of facilities for effective</p>

sorting and collection within the *site* and recycling/ reusing of waste.

BETA 0

4 Materials and Waste 4.P Prerequisite

MW P1 Minimum Waste Handling Facilities

Extent of Application	All buildings except one single family domestic building with not more than 3 floors, or domestic part of a composite building for one single family with not more than 3 floors, or a building not normally occupied or for transient stay (e.g. pump house, sewage treatment plant, carpark building).
Objective	Reduce waste generation at source, reduce pressure on landfill <i>sites</i> and help to preserve <i>non-renewable resources</i> by promoting recycling of waste materials
Credits Attainable	Prerequisite
Credit Requirement	Prerequisite achieved for meeting minimum provisions of waste recycle facilities for the collection, sorting, storage, recycling (recovered material) and disposal (waste).
Assessment	The assessment shall take into account how a system of waste collection, storage sorting, recycling and disposal can be managed for the buildings, with consideration given to the adequacy of space provisions on individual floors, within the building as a whole, and at local/ estate level. Opportunity should exist to manage different waste types, such as organic, non-recyclable and recyclable waste. There should be easy access to facilities for cleaning staff/contractors and/or building users, and for waste recycling and collection companies.

(a) Operational waste management plan

1. Provide proposal to:
 - 1.1 Identify and estimate quantities of expected waste streams (organic, recyclable and non-recyclable) of the development;
 - 1.2 Demonstrate compliance in the space requirement of waste recycling facilities (for waste storage, sorting and recycling) as listed in (2);
 - 1.3 Demonstrate storage for recycling of, as a minimum, materials listed in (3); and
 - 1.4 Demonstrate management plan, accessibility and hygiene. It includes the outlines of how the municipal solid waste disposal rate can be reduced by the waste management hierarchy - prevention, *reuse*, recycling, recovery and disposal; what is the collection and separation methodology of waste and recyclables; and how the building users dispose refuses and recyclables and janitorial staff collects and deliver to refuse storage and material recovery chambers (RS&MRC).

(b) Waste recycling facilities

1. Demonstrate RS&MRC of adequate size to cope with waste generated. Prescribed space requirements are listed below:

	Overall floor space of RS&MRC
Residential/ Domestic	1m ² per 347m ² usable floor space
Hotel	1m ² per 347m ² usable floor space
Retail/ Commercial/ Clubhouse	For UFS <39,600m ² , 2m ² per 925m ² usable floor space For UFS ≥39,600m ² , 1m ² per 925m ² usable floor space + 43m ²
Non-residential/	1m ² per 925m ² usable floor space

Non-domestic buildings other than Retail/ Commercial/ Clubhouse	
Remarks: the provision of waste and recycling facilities for the purpose of RS&MRC shall comply with statutory requirements under B(RS&MRC&RC)R. By regulation, the provision of refuse storage and material recovery room (RS&MRR) on every floor of a domestic building or the domestic part of a composite building is required. Hence, RS&MRR shall not to be included in the RS&MRC space requirement calculation. Additional areas of waste and recycling facilities provided apart from the statutorily required RS&MRR can be counted.	

2. Mechanical ventilation and air purifying facilities for every RS&MRC is statutory under Reg.12A of B(RS&MRC&RC)R. In addition, odour control measure shall be considered at MRR in accordance with PNAP APP-35.

(c) Minimum types of recyclables to be collected

1. Metal
2. Plastics
3. Paper/ Cardboard, and
4. Glass
5. For cluster of low-rise domestic houses where no separate waste recycling facility is provided, *intermediate waste recycling facility* (IWF) of area as listed in (2) below shall be provided within 60m walking distance from an external entrance for house. The requirements of IWF shall refer to the requirements of RS&MRR. Under Building (Refuse Storage and Material Recovery Chambers and Refuse Chutes) Regulations (B(RS&MRC&RC)R) and PNAP APP-35.
6. For domestic building or a domestic part of a composite building with a *site* area of less than 500m², the provision of the RS&MRC shall be exempted. To maintain the provision of the waste recycling facilities within the building, the alternative proposal shall be provided with details on the estimated waste streams and quantities from the building to justify its location and the adequate size of the RS&MRC provisions. Management plan, accessibility, hygiene and fire protection factors shall also be taken into consideration.

4 Materials and Waste 4.1 Materials Use

MW 2 Modular and Standardised Design

Extent of Application All buildings except for a single one-storey building with total floor areas not exceeding 230m²

Objective Encourage increased use of modular and standardised components in building design in order to enhance buildability and to reduce waste.

Credits Attainable 1 + 1 BONUS

Credit Requirement 1 credit for designing modular elements which contributed at least 50% (by mass, volume, dollar value or surface area) of the major elements and modules in the project.
For exemplary performance, ADDITIONAL BONUS credit for designing modular elements which contributed 90% or more (by mass, volume, dollar value or surface area) of the major elements and modules in the project.

Assessment

1. Provide a report that:
 - 1.1 Include specifications to demonstrate the extent of application of modular and standardised design of major elements and modules;
 - 1.2 Provide drawings to highlight the extent of application of modular and standardised design of major elements and modules; and
 - 1.3 Demonstrate the percentage of major elements and modules that are prescribed modular and standardised design elements and modules.
2. The unit may be mass/ volume/ dollar value/ surface area but shall be consistent throughout the assessment of this credit part.
3. Extent of modular and standardised design checklist

Structural elements	Structural beam system Concrete slab Concrete flooring
Facade elements	External wall Cladding unit Bay window (for <i>residential buildings</i>) Utility platform/ balcony (for <i>residential buildings</i>)
Architectural/ internal building elements	Internal partition/ wall panels Door sets Staircases

International Standard Organization. ISO 1006 Building construction – Modular coordination – Basic module (1983) and ISO 2848 Building Construction – Modular coordination – Principles and rules (1984) recommend that *modular components* shall be designed to have size of a multiple or subdivision of the basic module.

British Standards Institution. British Standard BS 6750. Specification for Modular coordination in building (1986) provides background on the requirements for modular coordination.

Development Bureau. Standardised Components and Practices gives guidance on accessing and locating standardised components and *modular components* that have been successfully used in construction, and finding out the standardised practices, including standard designs, construction methods, and techniques adopted in the construction industry. This contains a standardisation database of hyperlinks which promotes the wider use of standardised and *modular components* in local construction, with the public sector taking the lead.

Extent of Application	All Buildings.
Objective	Encourage material selection and adequate protection of exposed building elements to minimise the frequency of replacement and maximise materials optimisation.
Credits Attainable	1 + 2 BONUS
Credit Requirement	<p>(a) Building material selection appraisal 1 credit for appraisal report demonstrating a proactive approach to evaluate the durability of building materials, and at least 3 of relevant listed items.</p> <p>(b) Protecting vulnerable parts of the building from damage 1 BONUS credit for provide suitable protection measures, or designed features or solutions to prevent damage to vulnerable parts.</p> <p>(c) Protecting exposed parts of the building from material degradation 1 BONUS credit for incorporate appropriate design and specification measures to limit material degradation due to environmental factors.</p>
Assessment	<p>(a) Building components selection appraisal</p> <ol style="list-style-type: none"> 1. Conduct an appraisal report demonstrating a proactive approach to explain the details in building material selection with suitable durability that minimise necessary refurbishment or renewal and prevent excessive material use. 2. The report should cover at least 3 items out of the following. <ol style="list-style-type: none"> 2.1 Timber doorsets (fire rated doors) 2.2 Panel wall for partitions 2.3 Cement products (for architectural uses) 2.4 Tile adhesives 2.5 Ceramic tiles (floor tiles and wall tiles) 2.6 Aluminium windows 2.7 Heat soaked tempered glass 2.8 Drainage uPVC pipe and fittings 2.9 Other items may be proposed at discretion of the applicant 3. The building material shall be certified to a specified product certification scheme by a certification body with accreditation of Hong Kong Accreditation Service (HKAS), and issued with an accredited certificate bearing a Hong Kong Certification Body Accreditation Scheme (HKCAS) accreditation symbol or a statement on a certificate. <p>Alternatively,</p> <ol style="list-style-type: none"> 4. The building material shall be compared with at least one alternative material in terms of the anticipated service life. Service life refers to the expected period of life which ends when the material or equipment breaks down or loses its required physical functions. <p>(b) Protecting vulnerable parts of the building from damage</p> <ol style="list-style-type: none"> 1. Provide suitable protection measures, or designed features or solutions to prevent damage to vulnerable parts of the internal and external building and landscaping elements. This must include at least 2 items out of the followings: <ol style="list-style-type: none"> 1.1 Protection from the effects of high pedestrian traffic in main entrances, public areas and thoroughfares (corridors, lifts,

- stairs, doors)
- 1.2 Protection against any internal vehicular or trolley movement within 1m of the internal building fabric in storage, delivery, corridor and kitchen areas
- 1.3 Protection against, or prevention from, any potential vehicular collision where vehicular parking and manoeuvring occurs within 1m of the external building façade for all car parking areas and within 2m for all delivery areas.

(c) Protecting exposed parts of the building from material degradation

1. Conduct an appraisal report demonstrating a proactive approach to explain the design measures to protect exposed parts of the building from material degradation due to environmental factors. The report should cover at least 2 applicable building elements out of the followings, with the applicable environmental factors and material degradation effects.

Applicable Building Elements
<ul style="list-style-type: none"> • Foundation, substructure, lowest floor, retaining walls • External walls • Roof or balconies • Glazing: windows, skylight • External doors • Railings or balustrades (where exposed to external environment) • Cladding (where exposed to external environment) • Staircases or ramps (where exposed to external environment) • Hard landscaping
Environmental Factors
<ul style="list-style-type: none"> • Environmental agents, including: <ul style="list-style-type: none"> - Solar radiation - Temperature variation - Water or moisture - Wind - Rain • Extreme weather conditions, including: <ul style="list-style-type: none"> - High wind speeds - Flooding - Driving rain • Biological agents, including: <ul style="list-style-type: none"> - Vegetation - Pests, insects • Pollutants, including: <ul style="list-style-type: none"> - Air contaminants - Ground contaminants.
Material Degradation Effects
<ul style="list-style-type: none"> • Corrosion • Dimensional change, e.g. swelling or shrinkage • Fading or discolouration • Rotting • Leaching • Blistering • Abrasion
Remarks: Additional or alternative items may be proposed at discretion of the applicant.

BETA 0

4 Materials and Waste 4.2 Green Product/ Materials

MW 5 Sustainable Forest Products

Extent of Application All buildings, except for a building with an insignificant amount of timber products to be adopted (e.g. all timber products used in the building are five sets of doors only).

Objective Encourage the use of timber from well-managed forests.

Credits Attainable 1 + 1 BONUS

Credit Requirement 1 credit for demonstrating at least 30% for residential development and 50% for non-residential development of all timber and composite timber products used in the project are from sustainable sources/ recycled timber.

For exemplary performance, additional BONUS for demonstrating 90% or more of all timber and composite timber products used in the project are from sustainable sources/ recycled timber.

Assessment

1. Provide a report quantifying the amount of forest products used that are from sustainable source/ recycled (*reused* from other sites) timber, as a percentage of all timber and composite timber products used. Timber products or accessories of an insignificant amount and not forming part of timber doors, flooring, skirting, wall panels, ceiling systems and built-in furniture can be ignored in calculation for simplification. The unit may be mass/ volume/ dollar value but shall be consistent throughout the assessment of this credit.
2. The timber should conform to the requirement of sustainable forestry practice guidelines and accredited by recognised organisations, such as the non-profit Forest Stewardship Council (FSC) [1] or the American Forest and Paper Association (AFPA) [2] or “known licensed sources” [3]. The Client shall demonstrate compliance with the specification for timber products with the recommended certifications (e.g. FSC or AFPA).

4 Materials and Waste 4.2 Green Product/ Materials

MW 7 Ozone Depleting Substances

Extent of Application All Buildings
Objective Reduce the release of harmful ozone-depleting substances into the atmosphere.
Credits Attainable 2

Credit Requirement
(a) Refrigerants
 1 credit for the use of refrigerants with a value less than or equal to the threshold of the combined contribution to ozone depletion and *global warming potentials* using the specified equation.
(b) Ozone depleting materials
 1 credit for the use of products in the building fabric and services that avoid using ozone depleting substances in their manufacture, composition or use.

Assessment
(a) Refrigerants
 1. The air-conditioning and refrigeration equipment shall fulfil the following equation which determines a maximum threshold for the combined contributions to ozone depletion and *global warming potentials*:

$$LCGWP + LCODP \times 10^5 \leq 13$$

- LCGWP = $[GWPr \times (Lr \times Life + Mr) \times Rc] / Life$
- LCODP = $[ODPr \times (Lr \times Life + Mr) \times Rc] / Life$
- LCGWP = Lifecycle *Global Warming Potential* (kg CO2 /kw -Yr)
- LCODP = Lifecycle *Ozone Depletion Potential* (kg CFC 11/kw-Yr)
- GWPr = *Global Warming Potential* of Refrigerant (0 to 12,000 kg CO2/kg r)
- ODPr = *Ozone Depletion Potential* of Refrigerant (0 to 0.2 kg CFC11/kg r)
- Lr = Refrigerant Leakage Rate (0.5% to 2.0%; default of 2% unless otherwise demonstrated)
- Mr = End-of-life Refrigerant Loss (2% to 10%; default of 10% unless otherwise demonstrated)
- Rc = Refrigerant Charge
- Life = Equipment Life (10 years; default based on equipment type as listed in table below, unless otherwise demonstrated)

Equipment	Default equipment life
Window air-conditioner, heat pump	10 years
Unitary, split, packaged air-conditioner, package heat pump	15 years
Reciprocating and scroll compressor, reciprocating chiller	20 years
Absorption chiller	23 years
Water-cooled packaged air-conditioner	24 years
Centrifugal chiller	25 years

2. For systems with different types of equipment, a weighted average of all air-conditioning and refrigeration equipment shall be calculated using the following equation:

$$[\sum (LCGWP + LCODP \times 10^5) \times Q_{unit}] / Q_{total} \leq 13$$

Qunit = Gross ARI rated cooling capacity of an individual air-conditioning or refrigeration unit (kW)

Qtotal = Total gross ARI rate cooling capacity of all air-conditioning or refrigeration (kW)

3. Small air-conditioning units, defined as those containing less than 0.23 kg of refrigerant, and other equipment, such as standard refrigerators, small water coolers and any other cooling equipment that contains less than 0.23 kg of refrigerant, can be excluded from this assessment.
4. Provide a report by a suitably qualified person giving details of the air-conditioning and refrigeration equipment installed; and demonstrating that the *global warming potential* and ozone depletion potential of the refrigerants used in equipment meets the specified requirement. Reference shall be made to refrigerant suppliers and/or equipment manufacturer's data, etc.

(b) Ozone depleting materials

1. Provide a full description and specifications of all major thermal insulation and fire retardant materials specified in roof constructions, walls, chilled water pipes, refrigerant pipes, ductwork, advising the presence or otherwise of ozone depleting agents.
2. Where there is any doubt as to the ozone depletion potential of a material or product, details shall be ascertained from the supplier. Credit will be awarded where demonstration of reasonable effort has been made to avoid the use of products that have significant ozone depletion potential.

Remarks

(a) Additional Information

The Montreal Protocol has scheduled the phasing out of controlled substances, including chemicals containing chlorine and bromine used as refrigerants, solvents, foam blowing agents, aerosol propellants, fire suppressants, and for other purposes.

Ozone Layer Protection Ordinance (Cap. 403) gives effect to Hong Kong's international obligations to control the manufacture, import and export of ozone depleting substances.

Ozone Layer Protection (Controlled Refrigerants) Regulation requires the conservation of controlled refrigerants used in large scale installations and motor vehicles.

Ozone Layer Protection (Product Containing Scheduled Substances) (Import Banning) (Amendment) Regulation passed in 2009 extends the banning of the import of controlled products (including refrigeration and air-conditioning equipment, aerosol products such as metered dosed inhalers, insulation panel and pre-polymer) containing chlorofluorocarbons (CFCs) and halons to those containing other scheduled substances including *hydrochlorofluorocarbons* (HCFCs) by phases.

All products containing HCFCs, except dichlorotrifluoroethane (HCFC-123) has been banned since 1 January 2015. It is target to ban all products containing HCFCs starting from 1 January 2020.

The Amendment Regulation also bans the import of CFC-containing metered dosed inhalers and fire extinguishers containing HCFCs and bromochloromethane (BCM) from 1 January 2010.

Given that CFCs and HCFCs have been banned, except HCFC-123, HFCs offer near-zero ODP but some have comparatively high GWPs.

Refrigerant	ODP ^[1]	GWP ^[1]
<i>Hydrofluorocarbons</i>

HFC-413A	~0	1774
HFC-507A	~0	3900
<i>Hydrochlorofluorocarbons</i>		
HCFC-123	0.02	76
[1] – Sources:		
i. IPCC Second Assessment Report;		
ii. "World Resources Institute (2005), World Business Council for Sustainable Development";		
iii. U.S. Environmental Protection Agency.		

The U.S. Environmental Protection Agency provides information on suitable substitutes for ozone depleting substances, including refrigerants for various types of air-conditioning and refrigeration equipment, fire suppression, blowing agents, solvents, etc.

CIBSE GN01 outlines the hazards of using these refrigerants and provides design guidance for refrigeration systems, thermal insulation and fire protection systems.

ASHRAE Guideline 3-1996. Reducing Emission of Halogenated Refrigerants in Refrigeration and AS recommends practices and procedures that will reduce inadvertent release of halogenated refrigerants. The practices and procedures in this guideline cover emission reduction of halogenated hydrocarbon and halogenated ether refrigerants:

- (i) from stationary refrigeration, air-conditioning, and heat pump equipment and systems; and
- (ii) during manufacture, installation, testing, operation, maintenance, and disposal of equipment and systems.

4 Materials and Waste 4.2 Green Product/ Materials
MW 9 Use of Green Products

Extent of Application	All Buildings
Objective	Encourage to use green products that have low environmental impact.
Credits Attainable	2 + 4 BONUS

Credit Requirement (a) Certified green products
 1 credit for having at least 5% certified green products in one (1) of the listed categories (outside surface works, building façade and structures, interior non-structural components, and building services components).
 2 credit for having at least 5% certified green products in two (2) of the listed categories (outside surface works, building façade and structures, interior non-structural components, and building services components).
 1 additional BONUS credit for having at least 5% of certified green products under Construction Industry Council (CIC) Carbon Labelling Scheme/ HKGBC Green Product Accreditation and Standards (HK G-PASS) in one (1) of the listed categories (outside surface works, building façade and structures, interior non-structural components, and building services components).
 For exemplary performance, additional BONUS credit for having at least 25% of certified green products under CIC Carbon Labelling Scheme/ HK G-PASS in one (1) of the listed categories (outside surface works, building façade and structures, interior non-structural components, and building services components).

(b) Rapidly renewable materials
 1 BONUS credit for demonstrating 5% of all building materials/ products of interior non-structural components in the project is *rapidly renewable materials*.
 For exemplary performance, additional BONUS credit for demonstrating 25% of all building materials/ products of interior non-structural components in the project is *rapidly renewable materials*.

Assessment (a) Certified green products

1. Outside surface works

1.1 Use of certified green products contributing to at least 5% of all materials as listed below.

Outside surface works	i. Pavement Block
	ii. Stone (Natural/ Artificial)
	iii. Paint & Coating
	iv. Other items may be proposed at discretion of the applicant

1.2 Provide a report that:

1.2.1 Demonstrate the percentage calculation (by mass, volume, quantity, area or dollar value) of all items including certified green products

1.2.2 Include a summary table listing the product type, manufacturer, certification body, calculation and reference source;

1.2.3 Certificate(s) of the green products; and

1.2.4 Record photographs

1.3 For certified green products as specified in Construction Industry Council (CIC) Carbon Labelling Scheme/ HKGBC

Green Product Accreditation and Standards (HK G-PASS) are deemed to be included in the calculation.

- 1.4 For any green products, which have been certified under other internationally recognised schemes, the applicant shall refer to the of Worldwide Recognised Green Building Product Certifications and Standards under HKGBC's Eco-Product Directory (<http://epdir.hkgbc.org.hk/textdisplay.php?serial=32>) or provide the product's technical information with justification for BSL's consideration.

2. **Building façade and structures**

- 2.1 Use of certified green products contributing to at least 5% of all materials as listed below.

Building facade and structures	<ul style="list-style-type: none"> i. Cement ii. Concrete iii. Reinforcing bar iv. Structural steel v. Extruded aluminum product vi. Glazing vii. Other items may be proposed at discretion of the applicant
--------------------------------	---

- 2.2 Provide a report that:

2.2.1 Demonstrate the percentage calculation (by mass, volume, quantity, area or dollar value) of all items including certified green products

2.2.2 Include a summary table listing the product type, manufacturer, certification body, calculation and reference source;

2.2.3 Certificate(s) of the green products; and

2.2.4 Record photographs

- 2.3 For certified green products as specified in Construction Industry Council (CIC) Carbon Labelling Scheme/ HKGBC Green Product Accreditation and Standards (HK G-PASS) are deemed to be included in the calculation.

- 2.4 For any green products, which have been certified under other internationally recognised schemes, the applicant shall refer to the of Worldwide Recognised Green Building Product Certifications and Standards under HKGBC's Eco-Product Directory (<http://epdir.hkgbc.org.hk/textdisplay.php?serial=32>) or provide the product's technical information with justification for BSL's consideration.

3. **Interior non-structural components**

- 3.1 Use of certified green products contributing to at least 5% of any 5 items as listed below.

Interior non-structural components	<ul style="list-style-type: none"> i. Panel board ii. Ceramic tile iii. Plant-based fibre composite iv. Furniture v. Stone (Natural/ Artificial) vi. Wall covering vii. Paint & coating viii. Adhesive & sealant ix. Block for internal partition x. Synthetic carpet xi. Thermal insulation xii. Other items may be proposed at discretion of the applicant
------------------------------------	--

- 3.2 Provide a report that:
- 2.2.1 Demonstrate the percentage calculation (by mass, volume, quantity, area or dollar value) of all items including certified green products
 - 2.2.2 Include a summary table listing the product type, manufacturer, certification body, calculation and reference source;
 - 2.2.3 Certificate(s) of the green products; and
 - 2.2.4 Record photographs
- 3.3 For certified green products as specified in Construction Industry Council (CIC) Carbon Labelling Scheme/ HKGBC Green Product Accreditation and Standards (HK G-PASS) are deemed to be included in the calculation.
- 3.4 For any green products, which have been certified under other internationally recognised schemes, the applicant shall refer to the of Worldwide Recognised Green Building Product Certifications and Standards under HKGBC's Eco-Product Directory (<http://epdir.hkgbc.org.hk/textdisplay.php?serial=32>) or provide the product's technical information with justification for BSL's consideration.

4. Building services components

- 4.1 Use of certified green products contributing to at least 5% of all materials under either (a), (b) or (c) categories as listed below.

Building services components	(a) Lighting & electrical installation	<ul style="list-style-type: none"> i. LED lighting ii. CFL iii. Electronic ballast iv. Cable & wire v. Other items may be proposed at discretion of the applicant
	(b) Air-conditioning systems	<ul style="list-style-type: none"> i. Chiller ii. VRF split type system iii. AHU iv. FCU v. Cooling tower vi. Other items may be proposed at discretion of the applicant
	(c) Plumbing & drainage	<ul style="list-style-type: none"> i. Water pump ii. Sanitary wares-ceramic product iii. Other items may be proposed at discretion of the applicant

- 4.2 Provide a report that:
- 2.2.1 Demonstrate the percentage calculation (by mass, volume, quantity, area or dollar value) of all items including certified green products
 - 2.2.2 Include a summary table listing the product type, manufacturer, certification body, calculation and reference source;
 - 2.2.3 Certificate(s) of the green products; and
 - 2.2.4 Record photographs
- 4.3 For certified green products as specified in Construction

Industry Council (CIC) Carbon Labelling Scheme/ HKGBC Green Product Accreditation and Standards (HK G-PASS) are deemed to be included in the calculation.

- 4.4 For any green products, which have been certified under other internationally recognised schemes, the applicant shall refer to the of Worldwide Recognised Green Building Product Certifications and Standards under HKGBC's Eco-Product Directory (<http://epdir.hkgbc.org.hk/textdisplay.php?serial=32>) or provide the product's technical information with justification for BSL's consideration.

5. **Rapidly renewable materials**

- 5.1 Use of at least 5% of all building materials/ products of interior non-structural components under the following categories is *rapidly renewable materials*, such as bamboo, cork, natural linoleum, soy bean composite, strawboard, sunflower seed and wheatboard.

Interior non-structural components	<ul style="list-style-type: none"> i. Flooring ii. Panel/ partitions iii. Cabinetry/ built-in furniture iv. Insulation v. Other applications may be proposed at discretion of the applicant
------------------------------------	--

- 5.2 Provide a report that:

2.2.1 Demonstrate the percentage calculation (by mass, volume, quantity, area or dollar's value) of all items including *rapidly renewable materials*;

2.2.2 Include a summary table listing the product type, rapidly renewable material content, manufacturer, calculation and reference source;

2.2.3 Supporting documents of *rapidly renewable materials*; and

2.2.4 Record photographs

- 5.3 No material specified shall present a fire hazard when installed.

MW 10 Life Cycle Assessment

Extent of Application	All buildings
Objective	Encourage the design of structural elements and choice of materials that results in lower <i>embodied energy</i>
Credits Attainable	1
Credit Requirement	1 credit for demonstrating the <i>embodied energy</i> in the major elements of the building structure of the building has been studied and optimised through a Life Cycle Assessment (LCA).
Assessment	<ol style="list-style-type: none"> 1. Demonstrate reduced environmental effects by conducting a Life Cycle Assessment (LCA) on a baseline case, justified by the applicant, and the proposed case. The LCA should be conducted during design stage 2. The LCA should cover only the elements and materials used in the building foundations, walls, primary and secondary structures and building facade, and does not include building services system. 3. The service life of the baseline and proposed cases should be the same and at least 50 years. The same software tools and data sets should be used to evaluate both the baseline building and the proposed building, and report all listed impact categories. Data sets must be compliant with ISO 14044. In lieu to these requirements, the LCA tool developed by EMSD can also be used. 4. Select at least three of the following impact categories for reduction: <ol style="list-style-type: none"> 4.1 <i>Global warming potential</i> (greenhouse gases), in CO₂e; 4.2 Depletion of the stratospheric ozone layer, in kg CFC-11; 4.3 Acidification of land and water sources, in moles H⁺ or kg SO₂; 4.4 Eutrophication, in kg nitrogen or kg phosphate; 4.5 Formation of tropospheric ozone, in kg NO_x or kg ethene; and 4.6 Depletion of nonrenewable energy resources, in MJ. 5. Prepare a LCA report, including the following contents: <ol style="list-style-type: none"> 5.1 Quantity of the building materials 5.2 Assumptions made 5.3 Methodologies 5.4 Screenshots of input parameters 5.5 Results 5.6 Conclusions

4 Materials and Waste 4.3 Waste Reduction

MWA 11 Adaptability and Deconstruction

Extent of Application All Buildings

Objective Encourage the design of building interior elements and building services components that allow modifications to space layout, and to reduce waste during churning, refurbishment and deconstruction.

Credits Attainable 1 +1 BONUS

Credit Requirement

(a) Spatial adaptability
 1 credit for designs providing spatial flexibility that can adapt spaces for different uses, and allows for expansion to permit additional spatial requirements to be accommodated.
 Alternatively,

(b) Flexible engineering services
 1 credit for flexible design of services that can adapt to changes of layout and use.
 Alternatively,

(c) Structural adaptability
 1 credit for designs providing flexibility through the use of building structural systems that allow for change in future use, and which is coordinated with interior planning modules.
 1 additional BONUS credit for compliance with requirements listed in sub-item (a), (b) and (c).

Assessment

(a) Spatial adaptability

1. Provide a report presenting evidence as to how and the extent to which building adaptability and deconstruction is provided. The report shall include drawings and documents including building plans and detailed specifications together with elaboration and justification of specific design strategies that provide for the intended outcome.
2. Where it can be demonstrated that applicable good practices in respect of Spatial Adaptability have been adopted whenever feasible and at least 20% for residential development and 70% for non-residential development of the listed items in the checklist could be achieved, the credit shall be awarded.

Spatial Adaptability	<i>Residential Buildings</i>	<i>Commercial Buildings</i>	<i>Other Building Types</i>
Use of adaptable floor plans, including large grids that can be subdivided, etc.	[•]	•	•
Spaces designed for a loose fit rather than tight fit;	[•]	•	•
Inclusion of multifunctional spaces;	[•]	•	•
Design that allows interior fitting-out to use modular and prefabricated components;	[•]	•	•
Spaces designed such that minimum disruption will be caused to occupants due to physical change;	[•]	•	•

Easy relocation of partition walls that causes minimum damage to flooring or ceiling systems;	•	•	•
Partition walls are fully salvageable;	•	•	•
Separating long-lived components from short-lived components to reduce the complexity of deconstruction and churning so as to facilitate the collection process for recycling; and	[•]	•	•
Use of interior partitions that are demountable, reusable and recyclable, etc.	•	•	•
<p>Remarks:</p> <ul style="list-style-type: none"> - ASTM provides guidance for various types of buildings and uses [1, 2]. - Additions to the list may be proposed at the discretion of the applicant <p>[•] This item only applicable to clubhouse/ amenity facilities of the residential development</p>			

(b) Flexible engineering services

1. Provide a report presenting evidence as to how and the extent to which building adaptability and deconstruction is provided. The report shall include drawings and documents including building plans and detailed specifications together with elaboration and justification of specific design strategies that provide for the intended outcome.
2. Where it can be demonstrated that applicable good practices in respect of Flexible Engineering Services have been adopted whenever feasible and at least 20% for residential development and 70% for non-residential development of the listed items in the checklist could be achieved, the credit shall be awarded.

Flexible Engineering Services	<i>Residential Buildings</i>	Commercial Buildings	Other Building Types
Design that allows interior fitting-out to use modular and prefabricated components;	[•]	•	•
Luminaires, including electrical connection and mechanical fixing, are easily relocated within ceiling grid or uplighters are used;	[•]	•	•
Air diffusers on flexible ducts can be relocated at	[•]	•	•

1 ASTM International. Designation E1692-95a Standard Classification for Serviceability of an Office for Change and Churn by Occupants.
 2 ASTM International. Designation E1679-13 Standard Practice for Setting the Requirements for the Serviceability of a Building or Building-Related Facility and for Determining What Serviceability is Provided or Proposed.

minimum cost with minimum disruption to occupants;			
Exhaust air ducts for special exhausts are easy to install, and space and capacity are available in ceiling and duct shafts;	[•]	•	•
Pre-wired horizontal distribution systems in ceilings or floors, with spare capacity and easy access to accommodate change of workplace layouts; and	-	•	•
Reducing the use of embedded infrastructure for power, data and HVAC systems, etc.	[•]	•	•
<p>Remarks:</p> <ul style="list-style-type: none"> - Additions to the list may be proposed at the discretion of the applicant [•] This item only applicable to clubhouse/ amenity facilities of the residential development 			

(c) Structural adaptability

1. Provide a report presenting evidence as to how and the extent to which building adaptability and deconstruction is provided. The report shall include drawings and documents including building plans and detailed specifications together with elaboration and justification of specific design strategies that provide for the intended outcome.
2. Where it can be demonstrated that applicable good practices in respect of Structural Adaptability have been adopted whenever feasible and at least 20% for residential development and 70% for non-residential development of the listed items in the checklist could be achieved, the credit shall be awarded.

Structural Adaptability	<i>Residential Buildings</i>	Commercial Buildings	Other Building Types
Foundations allow for potential vertical expansion of the building;	-	•	•
Installation of isolation joints or other features avoid the potential for differential settlements and for progressive collapse due to accidental loading;	-	•	•
Reliance on a central core for lateral load resistance that allows for local modifications to the structure while maintaining complete structural integrity;	[•]	•	•

Wide structural grids	[•]	•	•
Lower floors allow for heavier live load;	[•]	•	•
Sufficient height to lower floors to enable a range of uses;	[•]	•	•
Building envelope is independent of the structure	[•]	•	•
Versatile envelope capable of accommodating changes to the interior space plan;	[•]	•	•
Means of access to the exterior wall system from inside the building and from outside;	[•]	•	•
Structural floor system that accommodates a number of mechanical and electrical service distribution schemes based on different occupancies; and	-	•	•
Provision of more than the minimum spatial areas and floor heights, etc.	[•]	•	•
<p>Remarks:</p> <ul style="list-style-type: none"> - Reference may be made to various publications [3] - Additions to the list may be proposed at the discretion of the applicant <p>[•] This item only applicable to clubhouse/ amenity facilities of the residential development</p>

4 Materials and Waste 4.3 Waste Reduction

MW 12 Enhanced Waste Handling Facilities

Extent of Application	All buildings except one single family domestic building with not more than 3 floors, or domestic part of a composite building for one single family with not more than 3 floors, or a building not normally occupied or for transient stay (e.g. pump house, sewage treatment plant, carpark building).
Objective	Encourage integrated waste management for operational reduction at source, effective sorting and collection within the <i>site</i> and recycling/ reusing of waste.
Credits Attainable	2 + 2 BONUS
Credit Requirement	<p>(a) Additional recyclables collection 1 credit for provision of facilities for collection, sorting, storage and disposal of 2 other recyclable streams.</p> <p>(b) Additional recycling facilities provision 1 credit for additional of facilities for collection, sorting, storage and disposal of recyclables.</p> <p>(c) Waste treatment equipment 1 BONUS for providing at least one set of waste treatment equipment.</p> <p>(d) Alternatives to recycling facilities 1 BONUS for provide alternative means of waste collection systems.</p>
Assessment	<p>(a) Additional recyclables collection</p> <ol style="list-style-type: none"> 1. Provide a report that demonstrates the adequacy of two (2) additional recyclables, in addition to prescribed recyclables in MWA P1, to be collected, such as food waste, organic landscape waste, and other (fluorescent light tubes, electronic products etc.). <p>(b) Additional recycling facility provisions to enable municipal solid waste (MSW) charging</p> <ol style="list-style-type: none"> 1. Provide a report that <ol style="list-style-type: none"> 1.1 Indicates on drawings the additional recycling facility provisions to enable municipal solid waste charging. It is expected that MSW charging will be implemented in the second half of 2019 at the earliest. 1.2 Demonstrates access to facilities for cleaning staff/ contractors and/or building users, and for waste recycling and collection companies. the details of how the municipal solid waste disposal rate can be reduced by the waste management hierarchy - prevention, <i>reuse</i>, recycling, recovery and disposal; what is the collection and separation methodology of waste and recyclables; and how the building users dispose refuses and recyclables and janitorial staff collects and deliver to RS&MRC. 1.3 Details of the additional recycling/ design features provided for the purpose of enabling the MSW charging, and improving the accessibility of building users, and operation and maintenance of the recycling facilities <p>(c) On-site waste processing facilities</p> <ol style="list-style-type: none"> 1. Where the consistent generation in volume of the appropriate operational waste streams is likely to exist, e.g. large amounts of

packaging or compostable waste generated by the building's use and operation, the following facilities are provided:

- 1.1 Static waste compactors or balers; situated in a service area or dedicated waste management space
- 1.2 Vessels for composting suitable organic waste resulting from the building's daily operation and use; OR adequate space for storing segregated food waste and compostable organic material prior to collection and delivery to an alternative composting facility
- 1.3 Where organic waste is to be stored or composted on *site*, a water outlet is provided adjacent to or within the facility for cleaning and hygiene purposes.

(d) Alternatives to recycling facilities

1. Automated waste collection systems and separate chutes for different waste types are accepted as a form of compliance as long as a management plan is in place, which can either be public (local authority) or private and requirements for separation are met.

MW P1 Waste Recycling Facilities

This prerequisite stipulates the minimum requirements for waste recycling facilities.

HWB 6 Waste Disposal Facilities

This credit addresses the hygiene aspects of waste disposal.

5	Energy Use	5.P Prerequisite 5.1 Energy Use Reduction and Control 5.2 Renewable and Alternative Energy Systems 5.3 Energy Efficient Equipment
	Introduction	<p>Electricity generation accounts for around 60% of the total CO₂ emissions from energy use in Hong Kong. Buildings account for 90% of our electricity consumption. Ensuring buildings are designed for good energy performance is a key factor in the conservation of energy.</p> <p>Power stations operate under licenses issued by the Director of Environmental Protection Department, requiring operators to employ best practicable means to control emissions to acceptable levels. However, a growth in demand is resulting in increasing power generation, transmission and distribution capacity. Mainly because of air-conditioning, buildings are responsible for much of the peak load that occurs in summer. Demand side management can reduce the rate of expansion of supply-side capacity.</p>
5.P	Prerequisite Background	EU P1 Minimum Energy Performance <p>BEAM provides incentives to achieve energy performance better than the minimum requirements of building energy codes. Therefore, compliance with the up-to-date Building Energy Codes (BEC) is the mandatory requirement governing the energy performance of building services installations. This is taken as the energy performance prerequisite for BEAM certification.</p>
5.1	Energy Use Reduction and Control Background	EU 1 Low Carbon Passive Design EU 2 Reduction of CO₂ Emissions EU 3 Peak Electricity Demand Reduction EU 4 Metering and Monitoring <p>The estimation of annual energy use and maximum electricity demand takes into account design improvements to the building envelope and the efficiency of building services systems including air-conditioning, lighting systems, electrical installations and equipment etc. It shall cover all aspects of energy use in buildings. BEAM gives credit to additional measures that address further improvement in the building energy efficiency.</p> <p>Passive building design allows buildings to respond to the local climate and reduce the reliance on active means to satisfy human comfort, and therefore reduces energy consumption and the associated carbon dioxide emissions. This is particularly important for <i>residential building</i> and BEAM Plus has developed an alternative path to assess passive elements for <i>residential buildings</i>.</p> <p>Through effective planning and architectural design, it is possible to improve building energy efficiency. As such, this section also assess various strategies including building <i>orientation</i>, layout plan and <i>external shading</i> devices etc.</p> <p>Both the prescriptive path and the performance path are developed for EU1, EU2 and EU3. Applicants can apply <u>either</u> path to suit the project's specific characteristics and externalities.</p>
5.2	Renewable and Alternative Energy Generation Background	EU 5 Renewable and Alternative Energy Systems <p>If energy consumption continues to increase at existing levels, projected carbon dioxide emissions generated for the year 2030 are expected to grow by more than 50% from the 2005 level. Effective use of renewable energy will reduce Hong Kong's reliance on fossil fuels and also our greenhouse gas emissions arising from the use of fossil fuels.</p> <p>Although the large scale application of renewable energy in buildings does not exist in Hong Kong, its wider use should be promoted in the interest of sustainable development. BEAM Plus credits only those meaningful installations that provide environmental benefits. The criteria for</p>

assessment have been set with reference to the percentage of the energy use in the assessed building that will be replaced by renewable sources. Furthermore, no distinction will be made on the chosen means such as solar hot water systems, building integrated photovoltaic panels or wind turbines, etc for substituting electricity or fuel by renewable energy. Hence, different or a combination of systems and equipment may be incorporated into a building.

5.3 Energy Efficient Equipment

Background

EU 6 Air-Conditioning Units

EU 7 Clothes Drying Facilities

EU 8 Energy Efficient Appliances

BEAM Plus gives credit to the designs that enhance the performance of equipment such as air-conditioning units. Likewise, the provisions of facilities / equipment that improve energy performance are also encouraged. Providing clothes drying facilities is a good practice for the unique high-rise and high density urban context of Hong Kong. With the introduction of the Energy Efficiency Labelling Scheme by EMSD, it becomes easier for the developers to select energy efficient appliances in the market.

BETA 0

5 Energy Use

5.P Prerequisite

EU P1 Minimum Energy Performance

Extent of Application

All buildings

Objective

To establish the minimum level of energy performance for the building services systems

Credit Requirement

Demonstrate performance improvement against the latest edition of Building Energy Code (BEC).

For BEC Governing Building Types:

Refer to the latest edition of BEC [1] to demonstrate that performance improvement is achieved in **both** of the following building services systems provided by the project owner:

- 1) Improve 2% of code specified minimum coefficient of performance (COP) for Air-conditioning equipment unit; and
- 2) Reduce 3% of code specified maximum allowable lighting power density for lighting installation.

For Non-BEC Governing Building Types:

All Non-BEC governing building types and spaces are required to demonstrate their compliance with the latest BEC on:

- 1) Air-conditioning equipment efficiency (full load COP); and
- 2) Lighting power density for listed space type in the code.

For building consist of BEC and non-BEC Governing Building or Space type:

All requirements of compliance listed in this credit are required.

Assessment

For BEC Governing Building Types:

1) Air-conditioning equipment

- 1.1. Improve 2% for each air-conditioning equipment corresponding minimum coefficient of performance (COP) at full load and specific standard rating condition given in the latest BEC (For BEC 2015 Edition, refer to tables 6.12a and 6.12b).
- 1.2. Improve 2% efficiency improvement for each room air-conditioners (i.e. single package window type and wall mounted split type) by using Energy Efficiency Grade 2 COP as the basis under the scope of the latest edition of Mandatory Energy Efficiency Labelling Scheme (MEELS) under Energy Efficiency (Labelling of Products) Ordinance (Cap. 598) [1], using cooling seasonal performance factor (CSPF), Fcsp.
- 1.3. Project using district cooling system and project without any air-conditioning installation (or not newly install an air-conditioning system) are not assessed under this criterion.

2) Indoor lighting system

- 2.1. Reduce 3% indoor lighting power density (LPD) of lighting installation in whole building by area-weighted method# compared with the latest edition of BEC.

$$\# \text{ Design Case: } \left(\frac{\sum[\text{LPD (Area A)} \times \text{Area A} + \text{LPD (Area B)} \times \text{Area B} + \dots]}{\sum[\text{Area A} + \text{Area B} + \dots]} \right)$$

1 Electrical and Mechanical Services Department, Code of Practice for Energy Efficiency of Building Services Installation [ONLINE] available at: http://www.beeo.emsd.gov.hk/en/mibec_beeo_codtechguidelines.html [Assessed 11 July 2017]

$$BEC\ Case: \left(\frac{\sum [BEC\ LPD\ (Area\ A) \times Area\ A + BEC\ LPD\ (Area\ B) \times Area\ B + \dots]}{\sum [Area\ A + Area\ B + \dots]} \right)$$
$$Lighting\ power\ reduction\ percentage = \left(1 - \frac{Design\ case}{BEC\ Case} \right) \times 100\%$$

LPD requirements for this prerequisite follows the latest edition of BEC (For BEC 2015 Edition, refer to Section 5.4). Exclude the lighting installations that are stated in the latest edition of BEC Technical Guideline [2] (For BEC TG 2015, refer to Section 5.1.2).

For non- BEC Governing Building Types:

3) Air-conditioning system

- 3.1. For spaces that are not governed by the latest BEC based on Cap. 610 Schedule 1 & 2, rated COP of the air conditioning equipment should comply with the minimum efficiency requirement stipulated in the code (For both full load and 75% load for VSD equipment).
- 3.2. The performance of the selected air conditioning unit types should refer to the corresponding equipment COP tables stipulated in the latest BEC (For BEC 2015 Edition, refer to tables 6.12a and 6.12b).
- 3.3. Room air-conditioners (included single package window type and wall mounted split type) under the scope of the latest edition of Mandatory Energy Efficiency Labelling Scheme (MEELS), Energy Efficiency (Labelling of Products) Ordinance (Cap. 598) should achieve equipment efficiency equivalent to the Energy Efficiency Grade 2 or above, using cooling seasonal performance factor (CSPF), F_{csp} .
- 3.4. Project using district cooling system and project without any air-conditioning installation (or not newly install with any air-conditioning system) are not assessed under this criteria.

4) Indoor lighting systems

- 4.1. For indoor areas that are not governed by the BEC based on Cap. 610 Schedule 1 & 2, LPD must comply with the maximum allowable values of the listed space type listed in the **latest** BEC.
- 4.2. For space that without a listed space type suitable for calculation from the BEC code, LPD must be the same as the design value.
- 4.3. LPD requirements for this prerequisite follows the **latest** edition of BEC (For BEC 2015 Edition, refer to Section 5.4). Exclude the lighting installations that are stated in the latest edition of BEC Technical Guideline ³(For BEC TG 2015, refer to Section 5.1.2)

For building consist of both BEC and non- BEC Governing Building Types:

Comply with all requirements.

² Electrical and Mechanical Services Department, Technical Guidelines on Building Energy Code 2015 Edition (TG-BEC 2015) [ONLINE] available at: http://www.beeo.emsd.gov.hk/en/pee/TG-BEC_2015.pdf [Accessed 11 July 2017]

³ Electrical and Mechanical Services Department, Technical Guidelines on Building Energy Code 2015 Edition (TG-BEC 2015) [ONLINE] available at: http://www.beeo.emsd.gov.hk/en/pee/TG-BEC_2015.pdf [Accessed 11 July 2017]

BETA

5 Energy Use**5.1 Energy Use Reduction and Control****EU 1 Low Carbon Passive Design****Extent of Application**

All buildings

Objective

Passive building design allows buildings to respond to the local climate; reducing the reliance on active means to meet human comfort. This in turn reduces energy consumption and its associated carbon dioxide emissions.

Credits Attainable

6

Credit Requirement

Passive designs that can reduce building HVAC load, facilitate natural ventilation and maximise daylight will be rewarded in this credit under **either** prescriptive path **or** performance path.

Option 1: Prescriptive Path

3 Credits for incorporating any 4 of the passive design strategies listed below:

- 1) Optimum Spatial Planning
- 2) External overhang (fix/ movable)
- 3) Vegetated building envelope
- 4) Cross Ventilation Provision
- 5) Daylighting Provision

Option 2: Performance PathHVAC Load Reduction**1) Built Form and orientation**

1 credit for reducing building envelope load from a hypothetical case with at least 22.5° difference in *orientation* with justification by simulation.

2) Optimum spatial planning

1 credit for demonstrating consideration of optimum spatial planning to enhance energy conservation with justification by simulation.

3) External shading devices

1 credit for the provision of fixed or movable *external shading* devices, in the form of vertical or horizontal sun shading feature with justification by simulation.

4) Vegetated building envelope

1 credit for the provision of vegetated building envelope with justification by calculation.

Natural Ventilation**5) Space layout for natural ventilation**

1 credit for demonstrating that space layout is designed to facilitate the utilisation of natural ventilation with justification by simulation.

Daylight**6) Space layout for daylight penetration**

1 credit for demonstrating that the space is well-lit by daylight and reduce occupants' dependency on artificial lighting with justification by simulation method.

Assessment**Option 1: Prescriptive Path**

Prepare a **passive building design report** with calculation, building elevations and drawings to demonstrate the compliance of adopting four (4) selected strategies.

1) Optimum Spatial Planning

Demonstrate the space planning complying with the following requirements:

1.1 For Non-open planned design:

Demonstrate at least 20% of external wall of the building to be occupied by non-conditioned space for buildings where the developer/owner has direct influence over the interior fit-out work for 50% or more of the *occupied space*

1.2 For Open planned design

Demonstrate at least 5% of external wall of the building to be occupied by non-conditioned space for buildings where developer/owner has direct influence over the interior fit-out work for less than 50% of the *occupied space*,

To document this strategy, the passive building design report should include the following information:

- a) Building floor layout with indication on complied area;
- b) Measurement of the perimeter length of the typical floor layout;
- c) Measurement of the non-conditioned space external wall length;
- d) Calculation of non-conditioned space external wall area; and
- e) Summary table showing the percentage calculation.

2) Fixed or movable overhangs

2.1 Incorporated >500mm overhangs for windows on *south orientated facade*

To document this strategy, the passive building design report should include the following information:

- a) Facade design drawings with highlighted overhangs
- b) Demonstrated that the length of overhangs is >500mm from *facade zone*.

3) Vegetated Building Envelope

3.1 Incorporate greenery for 50% roof of condition spaces; or Incorporate vertical greenery for 5% of external wall area for building condition spaces.

3.2 Demonstrate that the area of vegetation is at least 50% of the roof area. Roof of non-conditioned area (e.g. mechanical plant rooms) do not count towards the total roof area; OR

3.3 Demonstrate that the area of vegetation is at least 5% of the facade area. Facade of non-conditioned area (e.g. mechanical plant rooms) do not count towards the total facade area.

3.4 Only permanent plantation is considered as vegetation area.

To document this strategy, the passive building design report should include the following information:

- a) Drawings that demonstrate the area of vegetation on the roof area (or external wall area);
- b) Drawings that demonstrate the roof area of conditioned space (or the external wall area of conditioned space);
- c) Calculation for demonstrating the percentage of compliance;
- d) Demonstrate a reduction in U-value when compare with the project roof material (or external wall material); and
- e) Maintenance contract or undertaking statement that landscape maintenance personnel/company will be employed for the maintenance of building envelope vegetation.

4) Cross Ventilation provision

- 4.1 Provide cross ventilation for each *habitable space* of the building with reference to the cross ventilation requirement stipulated in the latest edition of the Guidelines on Design and Construction Requirements for Energy Efficiency of *Residential Buildings* [1] (For 2014 edition, refer to Part 3.2 Cross Ventilation Requirement

To document this strategy, the passive building design report should include the following information:

- a) Drawings of typical floors (or typical spaces design sections) showing the openable windows location and the cross ventilation path;
- b) Drawings illustrating natural ventilation assessment for re-entrant; and
- c) Calculation for demonstrating the compliance of minimum openable window area to floor area.

5) Daylighting Provision

- 5.1 Provide tall window for each *habitable space*, which the window height is more than 50% of the space depth.

To document this strategy, the passive building design report should include the following information:

- a) Drawings of typical floors sections (or typical spaces design sections);
- b) height of windows on the drawings;
- c) depth of spaces on the drawings; and
- d) Calculation for demonstrating the percentage of compliance.

Option 2: Performance Path

Prepare a **passive building design report** with numerical supporting for strategies incorporated in the building.

1) Built form and *orientation*

- 1.1 Conduct a building total energy analysis to demonstrate that the design building has incorporated a better build form and *orientation*. Evaluation is carried out by rotating the design building. The selected baseline condition (hypothetic case) should be at least 22.5° different from the designed building in *orientation*. A passive building design report should be provided to document the analysis and result.

To document this strategy, a passive building design report should include the following information:

- a) A summary of simulation result;
- b) hypothetic case building energy consumption;
- c) design case building energy consumption;
- d) Demonstration the *orientation* angle difference between hypothetic and design case; and
- e) Hourly data (i.e 8,760 hours) of building energy consumption for both the hypothetic case and the design case should be appended.

The simulation program used for energy modelling should meet the following criteria:

- a) Capable to perform hourly simulation (8,760 hours per year);

¹ Buildings Department, Guidelines on Design and Construction Requirements for Energy Efficiency of *Residential Buildings* [ONLINE] Available at: http://www.bd.gov.hk/english/documents/guideline/Guidelines_DCREERB2014e.pdf [Accessed 11 July 2017]

- b) Provide hourly variations in occupancy, lighting power, miscellaneous equipment power, thermostat setpoints, and HVAC system operation;
- c) Capable to model 10 or more thermal zones;
- d) Capable to model and simulate the thermal behaviour of a building and the interaction of its building fabric, air-conditioning, lighting and other relevant energy consuming equipment and systems;
- e) Capable to perform design load calculations to determine the required air-conditioning equipment capacities and air and water flow rates for both the design building and baseline building;
- f) Capable to model part-load performance curves for mechanical equipment;
- g) Capable to model capacity and efficiency correction curves for mechanical heating and cooling equipment; and
- h) Capable to model air-side economizers with integrated control

2) Optimum spatial planning

2.1 Demonstrate at least a 20% reduction in irradiation gain on facade of the *not normally occupied space* and non-conditioned space.

To document this strategy, the passive building design report should include the following information:

- a) Annual solar irradiation on each building elevation;
- b) Table summarizing external wall area of non-conditioned space on each *orientation* of building elevation; and
- c) Calculation demonstrating the design case compliance in irradiation gain reduction

$$\frac{\sum \text{Facade irradiation of non - conditioned facade area}}{\text{Overall Facade irradiation}} \geq 20\%$$

3) Fixed or movable horizontal / vertical external shading devices

3.1 Demonstrate the provision of *external shading* devices in reducing direct solar irradiation entering the building interior. Any architectural features that shade the building surfaces from direct sunlight are considered as shading devices.

3.2 Conduct an external solar irradiation simulation to demonstrate that the annual solar irradiation on the facade is 2% lower than the hypothetical case without a shading device.

To document this strategy, the passive building design report should include the following information:

- a) Simulation result of solar irradiation on each building elevation for both design case and hypothetical case; and
- b) Drawings illustrating the solar shading design.

4) Vegetated building envelope

4.1 Demonstrate that U-value of the roof area is reduced by 50% by vegetation. Roof of non-conditioned area (e.g. mechanical plant rooms) does not count into the total roof area; OR

4.2 Demonstrate that the area of vegetation on facade contribute 5% reduction on the U-value of facade. Facades of non-conditioned area (e.g. mechanical plant rooms) do not count into the total facade area.

4.3 Only permanent plantation is considered as vegetation area.

To document this strategy, the passive building design report should include the following information:

- a) Drawings that demonstrate the area of vegetation on the roof area (or external wall area);
- b) Drawings that demonstrate the roof area of conditioned space (or the external wall area of conditioned space);
- c) Calculation for demonstrating the percentage of compliance;
- d) Demonstrate a reduction in U-value when compare to the project roof material (or external wall material); and
- e) Maintenance contract or undertaking statement that landscape maintenance personnel/company will be employed for the maintenance of building envelope vegetation.

5) Space layout for natural ventilation

- 5.2 5.1 Demonstrate that at least 50% of openings and operable areas in each *occupied space* has an average incoming/outgoing velocity of 0.2 m/s
- 5.3 Demonstration that at least 20% of normally *occupied space*, in terms of floor area, has achieved a wind velocity of 0.2 m/s at 1.2m level above the finished floor.
- 5.4 A *CFD* simulation should be conducted in accordance with the AVA methodology and assessment area of the simulation model outlined in Technical Circular No.1/06 [2] to obtain the external wind pressures at the centre of the opening area. Another model that simulates the indoor flow pattern 1.2m level above the finished floor shall also be conducted using the external wind pressures computed by previous *CFD* model.
- 5.5 For buildings with 3 stories above grade or more, at least 3 typical stories (covering high, mid and low levels of buildings) with similar interior layout should be selected and studied for multi-storey building. For buildings with less than 3 stories, the simulation should cover all floors.
- 5.6 For buildings with identified *site* environmental problems, such as poor air quality or acoustics and noise problems, justification and evidence should be provided to substantiate the non-practicality of providing operable windows. Thus, demonstrating this credit part is not applicable.

To document this strategy, the passive building design report should include the following information:

- a) The derived incoming/outgoing velocity at the opening under 1 out of the 3 most prevailing wind directions in summer; and
- b) Calculation of the Area-Weighted Average Wind Velocity (AAWV) for the complied space.

6) Space layout for Daylight

- 6.1 Demonstrate that 25% of normally *occupied space* achieves spatial Daylight Autonomy_{300/25%} (sDA_{300/25%}). In other words, at least 25% of the area can receive at least 300 lux of sunlight for at least 25% of operating hours each year.
- 6.2 Compliance with the assessment criteria by demonstrating through daylight simulation satisfying the below requirements:
 - a) *Normally occupied spaces* shall be assessed (including *normally occupied spaces* without window);
 - b) Internal doors within a unit are assumed to be fully opened;
 - c) Calculation grids shall be no more than 0.6m²;
 - d) Assessment plane shall be placed at 0.8m above F.F.L. horizontally;

2 Housing, Planning And Lands Bureau Technical Circular No. 1/06 [ONLINE] Available at: https://www.devb.gov.hk/filemanager/en/content_679/hplb-etwb-tc-01-06.pdf [Accessed 11 July 2017]

- e) Assessment area shall cover typical floors of the lowest, topmost, middle level of each building within the *site* boundary. All *normally occupied spaces* shall be assessed if the project building has no typical floor;
- f) Annual sky file referencing a local climate file, such as an EnergyPlus weather format data file (*.epw), shall be used for sky model;
- g) The assessment shall cover hours between 8a.m. to 6p.m. local clock time, for a full calendar year, from January 1 to December 31;
- h) Overall external reflectance of an average of 0.2 for building (include the project development, unless provide other supporting materials) and 0.2 for ground;
- i) Internal wall, floor, ceiling reflectance can be refers to Table A1.12 in CIBSE - LG10/14 Lighting Guide 10: Daylighting - a Guide for Designers - LG10 [3]. If the finishes in the space is not completed, use the following default surface reflectance: 0.8 for ceiling, 0.2 for floors, and 0.5 for walls. The entire floor plate, except for the core is assume to be normally *occupied space*;
- j) Surrounding buildings and terrain shall be included in the model based on the GIS information from Lands Department;
- k) The surrounding building and large structures should be included in the simulation model. The surrounding area should be at least 2H (H being the building height (m) of the tallest building on the project *site*) or 200m away from the project *site* boundary, whichever is larger. The building geometry can be simplified as blocks; and
- l) The terrain area shall be in a size of at least, 10H (H being the building height (m) of the tallest building on the project *site*) or 1000m × 1000m, whichever is larger, with the project placed in the centre. Where smaller terrain area is desired, the Applicant should propose a terrain area with justification and the terrain area should be surrounded by a wall with a height same as the average height of the surrounding buildings.

To document this strategy, the passive building design report should include the following information:

- a) The industrial guidance/publications for arriving the adopted design criteria for the project;
- b) Software validation report;
- c) Simulation results of the spaces which have fulfilled the daylight illuminance requirements;
- d) Calculation for demonstrating the percentage of compliance; and
- e) Input and output report generated by software.

5 Energy Use**5.1 Energy Use Reduction and Control****EU 2 Reduction of CO₂ Emissions****Extent of Application**

All buildings

ObjectiveReduce the consumption of non-renewable energy and the associated carbon dioxide (CO₂) emissions to the atmosphere.**Credits Attainable**

10 + 5 BONUS

Credit Requirement

Select one of the 2 compliance path options described below.

OPTION 1 – PERFORMANCE PATH (1-10 CREDITS + 5 BONUS)Demonstrate a percentage of reduction on annual CO₂ emission of the proposed building performance compared with the baseline performance.1 to 10 credits for annual CO₂ emission reduction by the following saving percentages:

Credit(s)	Percentage of reduction of annual CO ₂ emission / %
1	3%
2	5%
3	7%
4	9%
5	11%
6	13%
7	15%
8	17%
9	19%
10	21%
10 + 1B	23%
10 + 2B	25%
10 + 3B	27%
10 + 4B	29%
10 + 5B	31%

OPTION 2 – PRESCRIPTIVE PATH (1-7 CREDITS)Demonstrate a prescriptive compliance in below listed item. *Residential buildings* and *non-residential buildings* should follow different path.

For building consist of both residential and non-residential parts, demonstrate the compliance for all requirements as listed below.

1) Passive Building Design Enhancement**1.1 Building Envelope**a) *Residential buildings* & Residents' Recreational Facilities (RRF)

Credit	OTTV / RTTV Requirement Improvement [1]
0.5	RTTV _{wall} Reduced by 5% OTTV _{RRF,tower} (if applicable) Reduced by 5% OTTV _{RRF,podium} (if applicable) Reduced by 20%
1	RTTV _{wall} Reduced by 10% RTTV _{roof} Reduced by 50% OTTV _{RRF,tower} (if applicable) Reduced by 10% OTTV _{RRF,podium} (if applicable) Reduced by 40%

1 Buildings Department - PNAP APP-156 - Design and Construction Requirements for Energy Efficiency of Residential Buildings; Buildings Department - Guideline on Design and Construction Requirements for Energy Efficiency of Residential Buildings 2014

b) All non-residential buildings

Credit	OTTV Requirement Improvement [2]
0.5	OTTV _{tower} Reduced by 5% OTTV _{podium} (if applicable) Reduced by 20%
1	OTTV _{tower} Reduced by 10% OTTV _{podium} (if applicable) Reduced by 40%

1.2 Natural Ventilation

a) Residential buildings

Credit	Performance Improvement
1	20% of habitable areas satisfy the ventilation requirements
2	40% of habitable areas satisfy the ventilation requirements

b) All non-residential buildings

Credit	Performance Improvement
1	<ul style="list-style-type: none"> - Net free unobstructed area of permanently open to operable envelope openings is equivalent to 9.5% of the net occupied floor area. - Interior room on occupied floor without direct openings to outdoors is ventilated through adjoining rooms, the opening between rooms shall be permanently unobstructed and have a free area of not less than 8% of the area of the interior room nor less than 2.3m².
2	<ul style="list-style-type: none"> - Net free unobstructed area of permanently open to operable envelope openings is equivalent to 12.5% of the net occupied floor area. - Interior room on occupied floor without direct openings to outdoors is ventilated through adjoining rooms, the opening between rooms shall be permanently unobstructed and have a free area of not less than 8% of the area of the interior room nor less than 2.3m².

2) Active System Design Improvement

Demonstrate further performance improvement as compared with the **Building Energy Codes (BEC) 2015** [3]

2.1 For each air-conditioning equipment:

Credit	Performance Improvement of minimum coefficient of performance (COP) at full load
1	3%
2	6%

2.2 Lighting System

Lighting power of lighting installation in whole building by area-weighted method as compared with the BEC 2015 code [3]:

Credit	Performance Improvement of lighting power
0.5	5%
1	10%

2 Buildings Department - PNAP APP-67 – Energy Efficiency of Buildings, Building (Energy Efficiency) Regulation; Code of Practice for Overall Thermal Transfer Value in Buildings 1995
3 Code of Practice for Energy Efficiency of Building Services Installation – Electrical and Mechanical Services Department HKSAR, 2015

2.3 Lift and escalator installation (N/A for building with No Lift & Escalators)

Credit	Performance Improvement
1	20% reduction from the maximum allowable electrical power

Assessment

OPTION 1 – PERFORMANCE PATH

Whole building energy simulation should be carried out in a prescribed methodology as listed below in order to quantify the potential savings due to energy saving measures and improvements over the relevant baseline model.

Simulation Software

Simulation program used for energy modelling should meet the following criteria:

- 1) Tested with industry standard methods: ANSI/ASHRAE Standard 140-2007 or equivalent.
- 2) Capable to perform hourly analysis (i.e. 8,760 hours per year);
- 3) Provide hourly variations in occupancy, lighting power, miscellaneous equipment power, thermostat setpoints, and HVAC system operation;
- 4) Capable to model 10 or more thermal zones;
- 5) Capable to simulate the thermal behaviour of a building and the interaction of its building fabric, air-conditioning, interior lighting and other relevant energy consuming equipment and systems;
- 6) Capable to perform design load calculations to determine the required air-conditioning equipment capacities and air and water flow rates for both the proposed building and baseline building;
- 7) Capable to model part-load performance curves for mechanical equipment;
- 8) Capable to model capacity and efficiency correction curves for mechanical heating and cooling equipment; and
- 9) Capable to model air-side economizers with integrated control

Baseline and Proposed Model Set-up

Develop the corresponding baseline building performance according to modelling set up guideline in Appendix 9.2 for different building types.

Exceptional Calculation Methods (ECM)

When no simulation program can adequately model a design, materials or device, an ECM can be used to demonstrate above-standard performance. Its adoption is subject to the justification (submitted by the Applicant) of its underlying principles, quantitative & qualitative techniques, assumptions etc. in detail.

Any claim of non-regulated load saving or strategies that lead to a different between proposed and baseline model is required to submit a narrative and to provide with ECM calculation.

ECM is allowed to create a representation of that element. If the methodology of approximation has not been previously published in any technical circular or FAQ, it is the responsibility of the applicant to submit a narrative explanation describing the simulation methodology and providing the calculations for the energy savings if necessary.

On-site Renewable Energy

On-site renewable energy generation is included in the proposed case calculation to further reduce the whole building CO₂ emission. By providing annual energy generation estimation details in the proposed case, the percentage reduction of CO₂ emission is accounted by the percentage of reduction from baseline CO₂ emission.

Equivalent Carbon Dioxide Emissions

Electricity: 0.7kg CO₂ per kWh electricity consumed [4]

Town gas: 3.141 kg CO₂ per unit of town gas consumed (1 unit of town gas = 48 mega-joules consumed)

Building Energy Report

The content should include the followings:

- 1) Executive summary
 - 1.1 Energy saving measures and management opportunities (EMOs) summary
 - 1.2 CO₂ emission and energy consumption reduction as compared with baseline
- 2) Introduction
 - 2.1 Methodology of energy performance assessment
 - 2.2 Project information
- 3) Description of EMOs
- 4) Modelling Parameters
 - 4.1 Operating schedule
 - 4.2 Input parameters summary table
- 5) Results and discussion
 - 5.1 Summarise the CO₂ emission reduction in percentage (%)
 - 5.2 Provide baseline and proposed case energy breakdown diagrams
- 6) Conclusions
 - 6.1 Conclude the major reasons for achieving CO₂ emission reduction

The report should be endorsed by a qualified engineer (accredited by the relevant professional institutions recognised in Hong Kong) who has at least 8-year experience in building energy modelling experience

OPTION 2 – PRESCRIPTIVE PATH

Prepare a summary report to demonstrate the compliance of each category below:

1) Passive Building Design Enhancement

1.1 Building Envelope

<i>Residential Buildings & Residents' Recreational Facilities (RRF)</i>	Provide RTTV _{wall} & RTTV _{roof} calculation and OTTV _{RRF,tower} & OTTV _{RRF,podium} calculation (if applicable) to demonstrate the envelope performance improvement with reference to the latest statutory requirement.
<i>All non-residential buildings</i>	Provide OTTV _{tower} & OTTV _{podium} calculation to demonstrate the envelope performance improvement with reference to the latest statutory requirement.

1.2 Natural Ventilation

<i>Residential Buildings & Residents' Recreational Facilities (RRF)</i>	Demonstrate that both cross ventilation and single-sided ventilation requirements is complied for all residential flat layouts and recreational facilities spaces. This approach can only be applied to single floor units or a single floor of a multi-floor unit. If the building is designed without

4 Environmental Protection Department. Guidelines to Account for and Report on Greenhouse Gas Emissions and Removals for Buildings (Commercial, Residential or Institutional Purposes) in Hong Kong, 2010
http://www.epd.gov.hk/epd/english/climate_change/files/Guidelines_English_2010.pdf

	<p>internal partitions, the designer must include a reasonable number of partitions to represent typical occupancy.</p> <p>Provide descriptions, mark-up on the habitable area layout plan and summary tables of total area compliance according to the detailed credit requirement stated in Appendix 9.2. Detailed cross ventilation and single-sided ventilation requirements of credit compliance are provided in Appendix 9.2.</p>
All non-residential buildings	<p>Provide sufficient permanent openings by demonstrating the compliance of following requirements on location and size of ventilation openings:</p> <ol style="list-style-type: none"> 1 Net free unobstructed area of permanently open to openable envelope openings is equivalent to 9.5% or 12.5% of the net occupied floor area. 2 Interior room on occupied floor without direct openings to outdoors is ventilated through adjoining rooms, the opening between rooms shall be permanently unobstructed (Door between rooms are deemed as permanently opening) and have a free area of not less than 8% of the area of the interior room nor less than 2.3m². <p>Provide mark-up on layout plan highlighting permanent openings on envelope and interior zone. Provide calculation of required natural ventilated openings area and the equivalent net occupied floor area in order to demonstrate the credit compliance.</p>

2) Active System Design Improvement

For BEC Governing Building Types:

2.1 Air-conditioning equipment:

Provide summary table of COP improvement in percentage (%) for **each** air-conditioning equipment as compared with the corresponding minimum COP at full load at specific standard rating condition specified under Section 6.12 of BEC 2015 [5]

For room air-conditioners (i.e. single package window type and wall mounted split type), the system performance should be compared with the scope of the Mandatory Energy Efficiency Labelling Scheme (MEELS) under Energy Efficiency (Labelling of Products) Ordinance (Cap. 598).

For assessment consistency, the following table provides the approximated equivalent COP table that converted with reference to the Code of Practice on Energy Labelling of Products 2014 [6] and BEC technical guidelines [7]. For assessment purpose, the equivalent COP value will be used as the baseline for all single packaged type and wall-mount split type equipment:

Type of air-conditioners	Equivalent COP
Single Package Type (Categories 1 - 2)	2.74
Split Type (Categories 3 - 4)	3.43

Project using district cooling system and project without any air-conditioning installation (or not newly install with any air-conditioning system) are not assess under this criteria.

2.2 Lighting System:

Provide summary table of lighting power reduction in percentage (%) for whole building lighting installation by area-weighted method[#] compared with Section 5.4 of BEC 2015 [8].(i.e. including carpark lighting system)

$$\# \text{ Design Case: } \left(\frac{\sum[\text{LPD (Area A)} \times \text{Area A} + \text{LPD (Area B)} \times \text{Area B} + \dots]}{\sum[\text{Area A} + \text{Area B} + \dots]} \right)$$

$$\text{BEC Case: } \left(\frac{\sum[\text{BEC LPD (Area A)} \times \text{Area A} + \text{BEC LPD (Area B)} \times \text{Area B} + \dots]}{\sum[\text{Area A} + \text{Area B} + \dots]} \right)$$

$$\text{Lighting power reduction percentage} = \left(1 - \frac{\text{Design case}}{\text{BEC Case}} \right) \times 100\%$$

Lighting power density (LPD) for baseline calculation should follow BEC 2015 ver.0 Section 5.4.

For spaces that are not governed by the code, LPD baseline should be developed per Appendix 9.2, *Interior General Lighting System* section, Baseline case column.

Exclude those lighting installations as specified in BEC TG-2015 [9] Section 5.1.2.in the calculation.

2.3 Lift and escalator installation:

If there is no lift and escalators installation within the project *site*, this criteria is not applicable.

-
- 6 Code of Practice on Energy Labelling of Products - Electrical and Mechanical Services Department HKSAR, 2014
 7 Technical Guidelines on Code of Practice for Energy Efficiency of Building Services Installation – Electrical and Mechanical Services Department HKSAR, 2015
 8 Code of Practice for Energy Efficiency of Building Services Installation – Electrical and Mechanical Services Department HKSAR, 2015
 9 Technical Guidelines on Code of Practise for Energy Efficiency of Building Services Installation – Electrical and Mechanical Services Department HKSAR, 2015

With reference to Section 8 of BEC 2015 [8], provide summary table on the maximum allowable electrical power reduction of lift and escalator installation.

For non-BEC Governing Building Types:

1) Air-conditioning system

For spaces that are not governed by the BEC 2015 (ver. 0) based on Cap. 610 Schedule 1 & 2, it is required to demonstrate a COP improvement in percentage (%) for all the Rated COP of each AC equipment performance for spaces that are not governed by the BEC 2015 (ver. 0) based on Cap. 610 Schedule 1 & 2 is required to demonstrate the COP improvement in percentage (%) for each air-conditioning equipment compared with the corresponding minimum coefficient of performance (COP) at full load at specific standard rating condition given from the code requirement under Section 6.12 of BEC 2015 [10].

For project connecting to a district cooling system, or project without an air-conditioning system (or newly install an air-conditioning system) is not covered in this criteria.

2) Lighting System:

Provide summary table of lighting power reduction in percentage (%) for whole building lighting installation by area-weighted method compared with the relevant space type as identified in Section 5.4 of BEC 2015.(i.e. including carpark lighting system)

$$\# \text{ Design Case: } \left(\frac{\sum[\text{LPD (Area A)} \times \text{Area A} + \text{LPD (Area B)} \times \text{Area B} + \dots]}{\sum[\text{Area A} + \text{Area B} + \dots]} \right)$$

$$\text{BEC Case: } \left(\frac{\sum[\text{BEC LPD (Area A)} \times \text{Area A} + \text{BEC LPD (Area B)} \times \text{Area B} + \dots]}{\sum[\text{Area A} + \text{Area B} + \dots]} \right)$$

$$\text{Lighting power reduction percentage} = \left(1 - \frac{\text{Design case}}{\text{BEC Case}} \right) \times 100\%$$

Lighting power density (LPD) for baseline calculation should follow BEC 2015 Section 5.4.

For spaces that are not governed by the code, LPD baseline should be developed per Appendix 9.2, *Interior General Lighting System* section, Baseline case column.

Lighting installations in BEC TG-2015 clauses 5.1.2 are excluded for calculation.

3) Lift and escalator installation:

If there is no lift and escalators installation within the project *site*, this credit is not applicable.

Refer to Section 8 of BEC 2015, provide summary table on the maximum allowable electrical power reduction of lift and escalator installation.

The report should be endorsed by a qualified engineer (accredited by the relevant professional institutions recognised in Hong Kong) who has at least 8-year experience in green building services system design.

5 Energy Use**5.1 Energy Use Reduction & Control****EU 3 Peak Electricity Demand Reduction****Extent of Application**

All buildings

Objective

Encourage energy conservation and methods to reduce peak electricity demand.

Credits Attainable

3

Credit Requirement

1 to 3 credits for peak electricity demand reduction by the following saving percentage:

Credit	Percentage of reduction of peak electricity demand / %
1	5%
2	10%
3	15%

Based on EU2 (Path 2) – Prescriptive Path:

Achieving 4 credit points in EU2 (prescriptive path) could achieve 1 credit in EU3.

Assessment**Based on EU2 (Path 1)– Performance Path:**

Perform whole building energy analysis of baseline and proposed case buildings and provide Building Peak Electricity Demand report that must be certified by a Professional Qualification holder with building energy modelling experience.

The Building Peak Electricity Demand report should include the following contents:

- 1) Introduction
 - 1.1 Methodology of energy performance assessment
 - 1.2 Project information
- 2) Description of Energy Conservation Measures (ECMs)
- 3) Modelling Parameters
 - 3.1 Operating schedule
 - 3.2 Input parameters summary table
- 4) Results and discussion
 - 4.1 Provide monthly profile for peak electricity demand in both baseline and proposed cases
 - 4.2 Identify the month with the highest electricity demand throughout a year in the baseline case

4.3 Identify the month with the highest electricity demand throughout a year the proposed case

4.4 Calculate the percentage reduction of the peak electricity demand

$$\left(1 - \frac{\text{Proposed case peak electricity demand (kW)}}{\text{Baseline case peak electricity demand (kW)}}\right) \times 100\%$$

The peak electricity demands in the baseline case and the proposed case used for the percentage calculation do not have to take place in the same month.

The report should be endorsed by a qualified engineer (accredited by the relevant professional institutions recognised in Hong Kong) who has at least 8-year experience in building energy modelling experience.

		1 Credit	1 BONUS

Sensors and Meters Requirement

- 1) Electricity metering should comply with BS EN [2] accuracy class 1 or equivalent.
- 2) Sensors for performance sub-metering should meet the minimum accuracy requirements in ASHRAE Standard 114 [3] or similar equivalent.

Interval and Recording

- 1) Metering should provide record at intervals of one hour or less and capable to record the item as required.
- 2) For residential development, all data recorded by the sub-metering system and monitoring systems should be collected monthly and be kept for at least 36 months.
- 3) For all non-residential development, all data recorded by the sub-metering system and monitoring system should be transferred to a Building Management System (BMS) or other data collection

² British Standard BS EN 60521:1995. Class 0.5, 1 and 2 alternating-current watthour meters.

³ ASHRAE. Standard 114-1986: Energy Management Control Systems Instrumentation, American Society of Heating, Refrigerating and Air-conditioning Engineers, Inc., USA. 1987.

system. The BMS or other data collection system should have sufficient capacity to store for at least 36 months.

b) Metering for tenanted area

Only buildings with tenanted areas can attempt this BONUS.

Demonstrate compliance by selecting one of the following paths for all tenanted area:

Compliance path 1: Landlord to Install Sub-metering

In all tenanted areas, provide electricity metering that allows separate monitoring of electricity use by:

- 1) HVAC system;
- 2) Lighting; and
- 3) Small power

Compliance path 2: Tenants to install sub-metering

Provide contractually binding lease document signed by both the project owner and the tenants which explicitly state the requirements of obtaining electricity usage data from the tenant's meters. The tenant's meters should separately monitor HVAC system, lighting and small power and should also be able to provide record at intervals of one hour or less and capable to record both electricity consumption (in kWh) and electricity demand (in kW and kVA).

For both path, the metering should provide record at intervals of one hour or less and capable to record both electricity consumption (in kWh) and electricity demand (in kW and kVA).

All data recorded should be transferred to a Building Management System (BMS) or other forms of data collection facilities. The BMS or data collection facilities should have sufficient capacity to store for at least 36 months.

A contractually binding lease document, with reference to HKGBC Green Tenancy Driver [4], is required to establish to ensure data could be shared between project owner and tenants, which explicitly state:

- 1) The Aim of improving the environmental performance of the building thereof the cost reduction and indoor quality
- 2) The requirements of obtaining electricity usage data from the tenant
- 3) Data and relevant information to be share between Landlord and Tenants are to be kept confidential unless for the purpose of management of the building
- 4) Landlord and Tenant are agreed to work collaboratively in setting up a Green Tenancy Committee (GTC)
- 5) Responsibility of the GTC at minimum:
 - a) Sharing the building operation data
 - b) Review the environmental performance of the premise
 - c) Setting up a Green Office Tenancy Plan with annual sustainability targets

4 HKGBC, Green Tenancy Driver for office Buildings
<https://www.hkgbc.org.hk/eng/got.aspx>

- d) Review the target and progress periodically

2) Related Credits

IDM 15 Interface for Metering

IDM 17 Occupant Engagement Platform

While this credit assesses the electricity consumption metering and monitoring system in the building, IDM 15 and IDM 17 encourages processing the data collected to useful information for facility managers' and occupants' use.

5 Energy Use

5.2 Renewable and Alternative Energy Generation

EU 5 Renewable and Alternative Energy Systems

Extent of Application

All buildings

Objective

Encourage the wider application of renewable energy sources in buildings.

Credits Attainable

6

Credit Requirement

(a) Solar energy feasibility study

1 credit for evaluating the building roof's potential for harnessing solar energy.

(b) On-site renewable energy application

1 to 5 credits for using on-site renewable energy systems to offset annual building energy consumption

Credit	Percentage of annual building energy consumption / %
1	0.5
2	1
3	1.5
4	2
5	2.5

Assessment

(a) Solar energy feasibility study

Conduct a feasibility study to evaluate the potential of standalone and building-integrated installation in harnessing solar energy including photovoltaic and solar water heating. The feasibility study report should include the following contents:

- 1 Consideration of PV, BIPV or Solar thermal potential installation
 - 1.1 Number of potential surfaces
 - 1.2 Potential surfaces area
 - 1.3 Height variation between roofs
 - 1.4 Potential shading from the surroundings including trees and adjacent buildings
 - 1.5 Potential shading from on-site building services equipment
 - 1.6 Structural provision for the system

- 2 Technical generation potential of solar energy
 - 2.1 Expected solar peak capacity
 - 2.2 Expected annual yield
 - 2.3 Project building energy use intensity (Default value could be used if EU 2 Performance path is not attempted) and the estimated percentage of reduction

- 3 Economics of solar energy
 - 3.1 Upfront installation costs
 - 3.2 Anticipated maintenance cost
 - 3.3 Anticipated annual electricity bills
 - 3.4 Anticipated cost saving
 - 3.5 Payback period

- 4 Conclusions
 - 4.1 Conclude whether the harnessing of solar energy is feasible for the project

- 5 *Roll-out plan* (if concluded to be feasible)
 - 5.1 Propose access and safety measures if solar energy is to be harnessed
 - 5.2 Propose recommendations to refine the roof design to maximise the usable roof space for M&E equipment

The feasibility must be certified by a qualified engineer (accredited by the relevant professional institutions recognised in Hong Kong) who has at least 5 years of post-qualification experience in renewable energy.

Note that the feasibility study imposes no obligation for implementation but encourages consideration of solar energy harnessing.

(b) Renewable energy application

Calculate the percentage of annual building energy consumption obtained from all the on-site renewable energy sources with reference to the design value calculated in EU 2 Reduction of CO₂ emissions.

$$\frac{\text{Annual energy generated by Onsite renewable energy systems (kWh)}}{\text{Annual energy use (kWh)}}$$

The calculation of annual energy provided by the on-site renewable energy systems should take into account of the followings:

- 1) Diurnal and seasonal variations in the external environmental conditions; and
- 2) Energy used and lost by the renewable energy systems should be discounted from the systems output

The annual energy use figure should be derived from the design case as stated in EU 2. The tenant's electrical loads, which are not controlled or influenced by the applicant, should be excluded from the annual energy use.

For systems that generate energy from on-site renewable sources, the energy generated should count into the "annual energy generated by on-site renewable energy systems" in the above equation. This excludes any energy used as process load.

For systems that provide services directly from on-site renewable sources, which will otherwise use fuel or electricity to produce those services, the equivalent amount of electricity to produce those services should count into

the “annual energy generated by on-site renewable energy systems” in the above equation.

Projects adopting EU 2 prescriptive path can pursue the credit by providing an estimation endorsed by a qualified engineer (accredited by the relevant professional institutions recognised in Hong Kong) who has at least 5 years of post-qualification experience in renewable energy, based on the reference figure in Table EU5-1.

Examples of renewable energy systems accepted in this credit include:

- 1) Solar photovoltaic (PV) System
- 2) Solar water heating system
- 3) Wind power system
- 4) Bio-gas heating / electricity generation
- 5) Biofuel

Project building energy use could make reference the following default figures if EU2 Performance path is not attempted [1],

Table EU5-1

#	Building Type	Total Energy use kWh/m ²	Controlled by Applicant
1	Office	222	40%
2	Enclosed and strip malls	268	50%
3	Retail shop	180	50%
4	Educational	166	100%
5	Other	334	100%

BETA 0

5 Energy Use**5.3 Energy Efficient Equipment****EU 6 Air-Conditioning Units****Extent of Application**

All buildings using window or split-type air conditioners.

Objective

To ensure that the installation of air-conditioning units is able to provide near optimum performance.

Credits Attainable

2

Credit Requirement**a) Compliance with manufacturer's recommendation**

1 credit for complying with manufacturer's recommended installation positions for optimal heat rejection.

b) Performance verification

1 credit for demonstrating the operating temperatures of all window type, split-type or packaged type air-conditioning units do not exceed manufacturer's recommendation for the specified COP in the manufacturer's technical specifications via computational simulation techniques.

Assessment**a) Compliance with manufacturer's recommendation****1 For project installed AC unit**

1.1 Demonstrate that all air-conditioning units, including window type and split type, fulfil the manufacturer's recommended installation positions for optimal heat rejection (not maintenance access space provision). The minimum separation criteria for the following shall be met:

- a. Separation from wall;
- b. Separation with other units; and
- c. Separation from wall at air-intake side.

1.2 Demonstrate that all installations comply with the refrigerant equivalent pipe-length of manufacturer's requirement for the specified COP in the manufacturer's technical specifications:

2 For project provide with AC platform but AC unit is not installed

1.2 Demonstrate that all air-conditioning platforms are capable to fulfil at least 3 manufacturers' recommended installation requirements for optimal heat rejection (not maintenance access space requirement). The minimum separation criteria for the following shall be met:

- a. Separation from wall;
- b. Separation with other units; and
- c. Separation from wall at air-intake side.

1.3 Demonstrate that all provisional installation point (AC platform) locations comply with at least 3 manufacturers' refrigerant

equivalent pipe-length of manufactures' requirement for the specified COP in the manufacturers' technical specifications:

b) Performance verification

Demonstrate, using Computational Fluid Dynamics (*CFD*), that all air-conditioning units do not exceed the manufacturer's recommended operative temperature.

For outdoor installations, make the following assumptions:

- 1) All wall surfaces are flat and air-tight;
- 2) Outdoor dry bulb temperature of 35°C;
- 3) No external wind effect; air is driven purely by buoyancy effect;
- 4) The effect of solar radiation is negligible; and
- 5) Air-conditioning units operate at full rated capacity.

Prepare a simulation report including the following content:

- 1) Objectives;
- 2) Building layout;
- 3) Information of air-conditioner installations including brand, model, dimension, cooling capacity (kW) and installed locations;
- 4) Modelling methodology;
- 5) Modelling assumptions;
- 6) Screen shots of all input parameters;
- 7) Results including temperature of all air-conditioning units; and
- 8) Conclusions.

The simulation report should be endorsed by a qualified engineer (accredited by the relevant professional institutions recognised in Hong Kong) with at least 5 years of relevant experience in *CFD* simulation.

Submittals**a) Compliance with manufacturer's recommendation**

5 Energy Use**5.3 Energy Efficient Equipment****EU 7 Clothes Drying Facilities**

Extent of Application *Residential buildings*

Objective Encourage wider use of natural means in lieu of gas or electricity for clothes drying purposes.

Credits Attainable 1 + 1 BONUS

Credit Requirement (a) Provision of clothes drying facilities

1 credit for providing permanent clothes drying facilities provision for all residential units under suitable location conditions.

(b) Demonstration of effectiveness

1 BONUS for demonstrating the effectiveness of permanent clothes drying facilities via computational analysis.

Assessment**(a) Provision of clothes drying facilities**

Fulfil below requirements for each permanent clothes drying facilities provision for each dwelling unit:

1. Permanent clothes drying facilities provision that are protected from water droplets and debris falling from higher levels; and
2. Permanent clothes drying facilities provision that are not adversely affected by air pollutants, including smoke, fumes and pollutants emitted from water heaters, cooking exhausts, discharges from air-conditioning units. The facilities provision is required to be located 0.5m horizontal distance away from air-conditioning units and 1.5m horizontal distance away from kitchen exhausts and operable windows.

(b) Demonstration of effectiveness

Prepare a computational analysis report with the following contents:

- 1 Description of the surrounding environment;
- 2 Building *orientation*;
- 3 Locations of drying facilities;
- 4 Methodology of study not limited to the software tools used, assumptions, calculation methods and screenshots of input parameters; and
- 5 Demonstration of the drying facilities effectiveness by meeting one of the below requirements.

5.1 Sunlight

1 Hours, with 5-minute reporting interval, of direct solar exposure in winter solstice (冬至日)

5.2 Wind

Minimum wind velocity of 0.5m/s. Winter prevailing wind with the highest wind frequency should be used.

The simulation report should be endorsed by a qualified engineer (accredited by the relevant professional institutions recognised in Hong Kong) with 5 years of relevant experience in *CFD* simulation.

5 Energy Use**5.3 Energy Efficient Equipment****EU 8 Energy Efficient Appliances****Extent of Application**

Residential buildings and hotel.

Objective

Encourage the wider use of energy efficient appliances.

Credits Attainable

2

Credit Requirement

1 credit when 60% of total rated power of appliances are certified energy efficient products.

1 additional credit when 80% of total rated power of appliances are certified energy efficient products.

Assessment

This credit assesses only the appliances provided by the developer.

The electrical appliances covered in this credit include the following items covered by the EMSD Energy Efficiency Labelling [per January 2017 version [1]. In other words, only appliances which are governed by the EMSD Energy Efficiency Labelling will be included in the denominator for percentage calculation.

- 1) Refrigerating appliances
- 2) Washing machines
- 3) Dehumidifiers
- 4) Electric clothes dryers
- 5) Electric storage water heaters
- 6) Television sets
- 7) Electric rice-cookers
- 8) Electronic ballasts
- 9) Induction cookers
- 10) Microwave ovens
- 11) Photocopiers
- 12) Fax machines
- 13) Multifunction devices
- 14) Printers
- 15) LCD monitors
- 16) Computers
- 17) Hot / cold bottled water dispensers

Provide a schedule of all electrical appliances including the location, quantity, model and the rated power.

1 Hong Kong Voluntary Energy Efficiency Labelling Scheme (EELS) website [ONLINE] Available at: http://www.emsd.gov.hk/en/energy_efficiency/voluntary_energy_efficiency_labelling_scheme/how_to_apply/index.html [Accessed 5 July 2017]

The appliances should achieve Grade 1 or 2 under the Energy Efficiency Labelling scheme [2,3] or USEPA Energy Star Rated [4] or certified under an equivalent labelling scheme.

6 Water Use**6.P Prerequisite****6.1 Water Conservation****6.2 Effluent****6.3 Water Harvesting / Recycling****Introduction**

Water is known to be in scarce supply in many parts of the world. Globally, water shortage is already a major issue. Hong Kong has been enjoying a reliable and economic supply of most of its fresh water needs from the Mainland.

However, with increased industrialisation of Guangdong Province there is likely to be greater competition for water supply in the pearl river region, meaning that water conservation may become a significant issue for Hong Kong in the future. Hong Kong should look into ways to improve the utilisation and conservation of water resources.

6.P Prerequisite**WU P1 Minimum Water Saving Performance****Background**

In Hong Kong, the WSD controls water quality, such as taste, odour, hardness, sediment, pH, the quantity of dissolved iron, etc., in order to provide water that meets the Guidelines for Drinking-water Quality recommended by the World Health Organization (WHO). While water quality satisfying WSD's requirement is the mandatory requirement, water conservation is another focus area under water category.

It is necessary to reduce the potable water consumption through the application of water saving fixtures and the use of non-potable water (e.g. harvested rainwater and recycled grey water).

6.1 Water Conservation**WU 1 Annual Water Use****WU 2 Water Efficient Irrigation****WU 3 Water Efficient Appliances****WU 4 Water Leakage Detection****WU 5 Twin Tank System****WU 6 Cooling Tower Water****Background**

Despite the continued decline in industrial water consumption there is an annual trend of rising consumption due to increasing domestic consumption. Based on projected population growth, the domestic and service uses, being the key components of our fresh water consumption, are expected to increase. Industrial use, for the same period, is expected to drop because of further decline in water intensive industries. Fresh Water Cooling Tower Scheme (FWCT Scheme) will contribute to consumption by the non-domestic sector.

Water from the Dongjiang River in Guangdong continues to be Hong Kong's main source of supply and accounting for about 70-80 percent of Hong Kong's needs. Hong Kong has limited options to reduce dependency on the Mainland, where water resources are becoming increasingly limited. There is opportunity to reduce potable water use through better design, management and user awareness.

6.2 Effluent**WU 7 Effluent Discharge to Foul Sewers****Background**

Whilst some 80% of users in Hong Kong are supplied with seawater for flushing purposes there are environmental impacts associated with the treatment and delivery of seawater, and the load imposed on municipal sewage treatment plants. Measures taken to reduce volumes of effluent flows have significant environmental benefits.

6.3 Water Harvesting and Recycling**WU 8 Water Harvesting and Recycling****Background**

There are opportunities to recycle used water and rain water in order to reduce the use of potable water. Additional benefits of potable water conservation can reduce energy use on transport and treatment of raw water.

BETA 0

6 Water Use**6.P Prerequisite****WU P1 Minimum Water Saving Performance**

Extent of Application	All buildings.
Objective	Reduce the consumption of potable water through the application of water saving devices with proven performance.
Credit Requirement	Demonstrate that the use of water efficient flow devices leads to an estimated annual saving of 10%.
Assessment	<p>Prepare a Potable Water Use Report which should include the following contents:</p> <ol style="list-style-type: none"> 1) Schedule including the types of fixture and the location and number of each type of fixture 2) Potable water use calculation following the below guidance 3) Annual potable water percentage of saving <p>Potable water use calculation should be based on the following methodology:</p> <ol style="list-style-type: none"> <p>1) Users</p> <p>Specify the number of users, male to female ratio according to the sanitary fitment schedule in the project General Building Plan. If no sanitary fitment schedule is available, use the assumed occupancy (9m²/person) and male to female ratio (1:1).</p> <p>For projects with accessible toilets, bathrooms and the like, it can be assumed that the rate of users with disability is 8.1% and the non-accessible toilets, bathrooms and the like are used by the remaining 91.9% of the dedicated users[1]</p> <p>The same number of users should apply to both the baseline case and the project design case.</p> <p>2) Operational days</p> <p>Specify the number of operational days per annum. Alternatively assume full year operation (365 days).</p> <p>The same operational days should apply to both the baseline case and the project design case.</p> <p>3) Number of use, product flow rate and duration of use</p> <p>Establish a baseline case for water consumption by the assumptions outlined in the following table. The calculation should only consider the listed fixtures.</p>

1 Hong Kong Monthly Digest of Statistics (January 2015) Feature Article – Persons with Disabilities and Chronic Diseases in Hong Kong. [ONLINE] Available at: <http://www.statistics.gov.hk/pub/B71501FB2015XXXXB0100.pdf>. [Accessed 04 July 2017]

Fixture type	Flow rate (L/min)	Operation time (sec)	Number of use per occupant per day
Shower (hotel and residential)	12	300	1
Shower (all buildings other than hotel and residential)	12	300	0.1
Non-mixing Type Water Taps (bathrooms and toilets)	4	10	5
Mixing Type Water Taps (bathrooms and toilets)	7	10	5

Establish the project design case. For each type of fixture, follow the below guidance to deduce the flow rate used for water use calculation:

- 1) Calculate the highest water pressure on each level of the building where the fixture is installed. Friction loss can either be neglected or accounted in the calculation with justification.
- 2) Identify the maximum and minimum pressure values calculated across the levels of the building where the fixture is installed
- 3) Plot the maximum and minimum values on the fixture flow rate curve
- 4) Deduce the highest flow rate corresponding to any pressure, between the maximum and minimum values, as the design flow rate for water use calculation

If automatic controls such as proximity sensors are used in the project to reduce the operation time, product catalogues are required to substantiate the performance.

The same number of use should apply to both the baseline case and the project design case.

4) Annual potable water percentage saving

Add up the total annual potable water use for both baseline and design. The annual potable water percentage saving can be calculated as follow:

$$1 - \frac{\text{Annual potable water use (design)}}{\text{Annual potable water use (baseline)}} \times 100\%$$

For *residential buildings*, demonstrate that the water taps in kitchen is rated grade 1 or 2 [2] by the WSD voluntary Water Efficiency Labelling Scheme.

BETA

6 Water Use**6.1 Water Conservation****WU 2 Water Efficient Irrigation**

Extent of Application All buildings with permanent greenery and permanent irrigation system.

Objective Reduce the reliance on potable water for irrigation.

Credits Attainable 2 + 1 BONUS

Credit Requirement 1 to 2 credits for reducing potable water consumption for irrigation in comparison with the baseline.

Credit(s)	Percentage of reduction of potable water consumption for irrigation / %
1	25%
2	50%
2 + 1 BONUS	100%

Assessment

Specify the area of each landscape type making up the total area of greenery in the project. For each landscape type, calculate the annual irrigation demand using the following formula.

$$ID = \sum_{\text{January}}^{\text{December}} \frac{ET \times K_L \times A \times CE}{IE}$$

ID : Annual irrigation demand satisfied by using potable water (L)

ET : Monthly reference evapotranspiration (mm)

K_L : Landscape coefficient of the landscape type

A : Area of the landscape type (m²)

CE : Efficiency of controller serving the landscape type

IE : Efficiency of irrigation method serving the landscape type

In theory the reference evapotranspiration is correlated to crop coefficient. For calculation, the reference evapotranspiration can be assumed to be equivalent to potential evapotranspiration. The potential evapotranspiration can be found on the Hong Kong Observatory website [1].

1 HKO - Monthly Sea Surface Temperature Recorded at North Point and Waglan Island and Monthly Total Evaporation and Potential Evapotranspiration Recorded at King's Park between 1961-1990

Refer to the below table for landscape coefficient.

Landscape type	Landscape coefficient (K_L)
Tree	0.5
Shrubs	0.5
Groundcovers	0.5
Mixed (Trees + Shrubs + Groundcovers)	0.6
Turfgrass	0.7

Refer to the below table for irrigation method.

Irrigation method	Irrigation efficiency (IE)
Manual	0.5
Drip – Standard	0.7
Drip – Pressure compensated	0.9
Fixed Spray	0.65
Micro Spray	0.7
Rotor	0.7

Calculate the total Irrigation demand that uses potable water in both baseline and project design cases by the above formula. Sum up the calculated ID(s) for all landscape types. The irrigation demand should cover all permanent greenery in the project. For private garden not under the control of the building management, irrigation demand for the design case should be assumed the same as the baseline case.

1) Baseline

The composition of landscape type making up the permanent greenery in the project should be the same as design case.

Assume all landscape types are irrigated manually (ie. IE = 0.5) and no controller is used (ie. CE = 1).

Assume no *reused* or recycled water is used.

2) Design

Specify the irrigation method and controller (if used) for each landscape type and calculate the ID correspondingly.

If controllers, including weather-based and moisture sensor-based, are used, the CE should be supported by manufacturer's documentation.

If harvested rainwater or recycled grey water is used to replace potable water for irrigation, the corresponding annual amount of replaced water can be deducted from the irrigation demand. The calculation method of the amount of harvested rainwater and recycled grey water should be consistent with WU 8.

Demonstrate sufficient collection tank (or retention pond) capacity:

2.1 Harvested rainwater: 10-20 days [2] of the month with the peak rainfall (assume 30 days in a month).

2.2 Recycled grey water: 8-10 hours

The percentage reduction in annual irrigation demand that uses potable water can be calculated as follow:

$$1 - \frac{\text{ID (design)}}{\text{ID (baseline)}} \times 100\%$$

Alternatively, if self-sustained plants are used to form all permanent greenery, which do not require irrigation beyond their establishment period (maximum two years), provide justification to explain why no irrigation will be required based on local rainfall and plants' water demands. The justification should be endorsed by a professional landscape architect or ecologist. Two credits can be attained.

6 Water Use

6.1 Water Conservation

WU 4 Water Leakage Detection

Extent of Application

All buildings.

Objective

To identify water leakage once detected for the arrangement of maintenance work.

Credits Attainable

1

Credit Requirement

1 credit for installing water leakage detection systems in all municipal potable water tank rooms.

Assessment

Demonstrate that water leakage detection systems are installed in all municipal potable water tank rooms, including rooms comprising potable water tank, flushing water tank, irrigation tank and cleansing water tank.

Water tank rooms, which consists of non-potable water tank only and fire services tank only, are not assessed.

Water tank rooms which have multiple water tanks should have at least one leakage detection system.

The detection systems should have the capability to alert the operation station or the security station and identify the room with leakage when leakage is detected.

WU 5 Twin Tank System

Extent of Application All buildings.

Objective To reduce the water wastage during the maintenance or cleaning of the water tanks and provide an uninterrupted potable and flush water supply to building users.

Credits Attainable 1

Credit Requirement 1 credit for providing twin tank for potable water supply system and flushing water supply system.

Assessment

Indirect feed system

Twin tanks are installed for potable and flushing supply water systems (including both sump, roof and transfer tanks) for all buildings in the assessment boundary.

Direct feed system

Twin tanks are installed for flushing supply water systems for all buildings in the assessment boundary.

Two compartment tank and two separate identical tanks are accepted as twin tank.

For both systems, each compartment / tank of the twin-tank shall be equipped with:

- 1) A duplicated sets of inlet, outlet and associated overflow and drainage pipeworks;
- 2) A stop valve at the inlet of each tank compartment to ensure that water will not get into the compartment when it is being cleaned; and
- 3) An automatic pump control switch at the downstream side of each sump pump to protect the up-feed system particularly when the stop valve for the tank compartment is closed.

6 Water Use **6.1 Water Conservation****WU 6 Cooling Tower Water**

Extent of Application All buildings equipped with cooling tower using potable water as makeup water.

Objective To reduce potable water consumption for cooling tower makeup.

Credits Attainable 1

Credit Requirement 1 credit for achieving 7 or more cycles of concentration with acceptable water quality.

Assessment The ratio between the concentration of dissolved solids in the cooling tower and the make-up water should be 7 or more. Demonstrate that the corresponding make-up water pumps can provide sufficient flow rate and pressure to sustain the specified cycle of concentration.

All cooling tower using potable water within the assessment boundary should comply with this requirement.

Submit cooling tower water treatment proposal developed in accordance to the latest EMSD Code of Practice for Fresh Water Cooling Tower [1] to demonstrate minimum cycles of concentration of 7 or more is designed and adopted.

After project completion, submit EMSD Form EE CT3 [2] regarding the cooling water sampling results and the associated water sampling test report to substantiate satisfactory cooling water quality.

6 Water Use**6.2 Effluent****WU 7 Effluent Discharge to Foul Sewers****Extent of Application**

All buildings.

Objective

To reduce the volumes of sewage discharged from buildings thereby reducing burdens on municipal sewage services and treatment facilities.

Credits Attainable

1

Credit Requirement

1 credit for demonstrating a reduction in annual sewage volumes by 20% or more.

Assessment

The **flushing water use report** should include all the following contents:

- 1) Schedule including the types of fixture, location, number of occupants, daily usage and flushing volumes.
- 2) Flushing water use calculation following the below guidance
- 3) Annual flushing water percentage saving

Flushing water use calculation should be based on the followings:

1) Occupancy

Specify the number of users, male to female ratio according to the sanitary fitment schedule in the project General Building Plan. If no sanitary fitment schedule is available, use the assumed occupancy (9m²/person) and male to female ratio (1:1).

For projects with accessible toilets, bathrooms and the like, it can be assumed that the rate of users with disability is 8.1% and the non-accessible toilets, bathrooms and the like are used by the remaining 91.9% of the dedicated users [1].

The same number of users should apply to both the baseline case and the project design case.

2) Operational days

Specify the number of operational days per annum. Alternatively assume a full year operation (i.e. 365 days).

The same operational days should apply to both the baseline case and the project design case.

3) Number of use

The same number of use should apply to both the baseline case and the project design case.

1 Hong Kong Monthly Digest of Statistics (January 2015) Feature Article – Persons with Disabilities and Chronic Diseases in Hong Kong. [ONLINE] Available at: <http://www.statistics.gov.hk/pub/B71501FB2015XXXXB0100.pdf>. [Accessed 04 July 2017]

Fixture type	Number of use per day
Male WC Single Flush (non-residential)	1
Male WC Dual Flush (non-residential)	1 full flush volume
Female WC Single Flush (non-residential)	5
Female WC Dual Flush (non-residential)	1 full and 4 low volume
Single Flush WC (Residential)	5
Dual Flush WC (Residential)	1 full and 4 low volume
Urinal	4

4) Flushing volume

Based on the above, establish a baseline case for flushing water consumption by the following assumptions. While dual flush WC is used, a single flush WC baseline can be adopted.

Fixture type	Flushing volume (L / flush)
Single Flush WC	7.5
Urinal	2.5

Establish the flushing water consumption for the project design case based on the flushing volumes shown in the catalogues and specifications. Note that no pressure calculation is required.

5) Annual flushing water percentage saving

The annual flushing water percentage saving can be calculated as follows:

$$1 - \frac{\text{Annual flushing water use (design)}}{\text{Annual flushing water use (baseline)}} \times 100\%$$

6 Water Use**6.3 Water Harvesting and Recycling****WU 8 Water Harvesting and Recycling**

Extent of Application All buildings.

Objective To encourage harvesting of rainwater and recycling of grey water in order to reduce consumption of potable water.

Credits Attainable 2 + 1 BONUS

Credit Requirement (a) Harvested rainwater

1 credit for harvesting of rainwater that achieve a reduction of 5% or more in the consumption of potable water.

(b) Recycled grey water

1 credit for recycled grey water that achieve a reduction of 5% or more in the consumption of potable water.

(c) Exemplary water recycling

1 BONUS credit where harvested rainwater, recycled grey water or a combination of both leads to a reduction of 10% or more in the consumption of potable water.

Assessment**(a) Harvested rainwater****1.1 Calculation of the monthly harvested rainwater yield**

Accepted rainwater sources are from roofs, permeable paving, non-permeable paving and surface runoff from grass and landscaped areas [1]. For each source, calculate the monthly harvested rainwater yield throughout the year using the below formula.

$$Y_r = A_c \times R_m \times C_r$$

Y_r is the monthly average rainwater yield (litre/month)

A_c is the collection area (m²)

R_m is the monthly mean of rainfall in Hong Kong between 1981-2010 (mm) [2]

C_r is the run-off coefficient

If an in-line filter is installed to the rainwater collection system, a filter efficiency, N_f , should be incorporated into the above equation, which can be assumed to be 0.9.

For typical run-off coefficient, use the lower limits specified in Table 3-1 in the WSD Technical Specifications [1]. Provide supplier's product catalogue to substantiate if other values are used.

-
- 1 Water Supplies Department – Technical Specifications On Grey Water Reuse And Rainwater Harvesting (1st Edition) May 2015. [ONLINE] Available at: http://www.wsd.gov.hk/filemanager/en/content_1081/technical_spec_grey_water_reuse_rainwater_harvest.pdf [Accessed 05 July 2017].
- 2 Hong Kong Observatory – Monthly Meteorological Normals for Hong Kong. 2017. [ONLINE] Available at: http://www.hko.gov.hk/cis/normal/1981_2010/normals_e.htm [Accessed 05 July 2017].

1.2 Calculation of the monthly demand for harvested rainwater

Calculate the monthly demand for harvested rainwater throughout the year which includes only the activities which originally would have used potable water but is then replaced by harvested rainwater in the project.

Accepted activities include flushing, irrigation (excluding manual irrigation), water features, car washing, external cleaning, fire-fighting and industrial processes.

1.3 Comparison of yield and demand

Compare the total yield and the total demand, month by month, to calculate the amount of potable water replaced by harvested rainwater.

For months when the yield exceeds the demand (i.e. surplus), the amount of replaced potable water is equivalent to the demand. For months when the demand exceeds the yield (i.e. shortage), the amount of replaced potable water is equivalent to the yield.

1.4 Calculation of the annual amount of potable water replaced by harvested rainwater

Add up the replaced water throughout the year to show the annual amount. This is the nominator for the calculation of percentage reduction.

1.5 Calculation of the percentage reduction in potable water use replaced by harvested rainwater

The denominator should at least include the annual potable water use for irrigation and flushing (figures should be consistent with WU 2 design case, excluding manual irrigation, and WU 1 design case; *reused* and recycled water are not considered in the calculation.), and, only if harvested rainwater is used for the activity, the annual potable water use for water features, car washing, external cleaning, fire-fighting and industrial processes.

1.6 Sufficient tank storage capacity

Demonstrate the collection tank(s) (or retention pond) has sufficient capacity.

Harvested rainwater: 10-20 days [3] of the month with the peak rainfall (assume 30 days in a month).

1.7 Water quality standards

3 Water Supplies Department, Technical Specifications on Grey water *reuse* and Rainwater Harvesting [ONLINE] Available at: http://www.wsd.gov.hk/filemanager/en/content_1081/technical_spec_grey_water_reuse_rainwater_harvest.pdf [Accessed 05 July 2017].

Demonstrate the harvested rainwater, after treatment, meet the recommended water quality standards prescribed in in the WSD Technical Specifications [4].

(b) Recycled grey water

2.1 Calculation of the monthly recycled greywater yield

Accepted grey water sources are wash basins, baths, showers, dishwashers, laundry machines, kitchen sinks, cooling tower bleed-off water and air conditioning condense [5].

Follow the calculation method specified in Section 3.4 in WSD Technical Specifications On Grey Water Reuse And Rainwater Harvesting [7]. Provide further calculation for air conditioning condense.

2.2 Calculation of the monthly demand for recycled greywater yield

Calculate the monthly demand for harvested rainwater throughout the year which includes only the activities which originally would have used potable water but is then replaced by recycled greywater in the project.

Accepted activities include flushing, irrigation (excluding manual irrigation), water features, car washing, external cleaning, fire-fighting and industrial processes.

2.3 Comparison of yield and demand

Compare the yield and the demand, month by month, to calculate the amount of potable water replaced by recycled greywater.

For months when the yield exceeds the demand (i.e. surplus), the amount of replaced potable water is equivalent to the demand. For months when the demand exceeds the yield (i.e. shortage), the amount of replaced potable water is equivalent to the yield.

2.4 Calculation of the annual amount of potable water replaced by recycled greywater

Add up the replaced water throughout the year to show the annual amount. This is the nominator for the calculation of percentage reduction.

2.5 Calculation of the percentage reduction in potable water use replaced by recycled greywater

The denominator should at least include the annual potable water use for irrigation and flushing. The figures should be consistent to:WU 2 design case, excluding manual irrigation, and should be consistent to WU 1 design case, without deducting any reused / recycled water. Only if recycled greywater is used for the activity,

5 Water Supplies Department – Technical Specifications On Grey Water Reuse And Rainwater Harvesting (1st Edition) May 2015. [ONLINE] Available at: http://www.wsd.gov.hk/filemanager/en/content_1081/technical_spec_grey_water_reuse_rainwater_harvest.pdf. [Accessed 05 July 2017].

the annual potable water use for water features, car washing, external cleaning, fire-fighting and industrial processes.

2.6 Sufficient tank storage capacity

Demonstrate the collection tank(s) has sufficient capacity.

Recycled grey water: 8-10 hours

2.7 Water quality standards

Demonstrate the recycled grey water, after treatment, meet the recommended water quality standards prescribed in Table 1-1 in the WSD Technical Specifications [6].

(c) Exemplary water recycling

In addition to the requirements stipulated in parts (a) and (b), demonstrate that harvested rainwater, recycled grey water or a combination of both leads to a reduction of 10% or more in the consumption of potable water.

7 Health and Wellbeing

7.P Prerequisite

7.1 Design for Green Living

7.2 Inclusive Design

7.3 Indoor Environmental Quality

Introduction

This section of BEAM Plus considers the broader perspectives of sustainable buildings as well as the building occupants' health and wellbeing. The broader sustainable issues include provisions of hygiene and amenities maintenance provided in the building, which have impact on the quality of working and living environments. Indoor environmental quality (IEQ) includes indoor air quality and ventilation provisions that safeguard health. Considerations of these issues, as well as thermal comfort, lighting, acoustics and noise, impact on well-being, comfort and productivity.

7.P Prerequisite

HWB P1 Minimum Ventilation Performance

Background

This requirement ensures that ventilation systems of the premises have been designed according to recognised procedures to provide a minimum ventilation of sufficient quality and quantity.

7.1 Design for Green Living

HWB 1 Healthy and Active Living

HWB 2 *Biophilic Design*

Background

Biophilic design provides users constant interaction with living things and natural surroundings to nurture the innate human-nature connection and to address human psychological need to be around life and life-like processes. Design features and amenities, e.g. pedestrian amenities and stairs promotion, can facilitate more healthy and active living.

7.2 Inclusive Design

HWB 3 Inclusive Design

Background

Designs that allow users to enjoy spaces safely, easily and with dignity, and ensure efficient services to meet their needs, etc. They enhance the quality and efficiency of built environments and thereby ensure buildings to be more sustainable.

7.3 Indoor Environmental Quality

HWB 4 Enhanced Ventilation

HWB 5 Waste Odour Control

HWB 6 Acoustic and Noise

HWB 7 Indoor Vibration

HWB 8 Indoor Air Quality

HWB 9 Thermal Comfort

HWB 10 Artificial Lighting

HWB 11 Daylight

HWB 12 Biological Contamination

Given that on average people in Hong Kong spend around 85% of their time indoors, indoor environmental conditions have a significant impact on the quality of life. Buildings should provide safe, healthy, convenient and efficient indoor spaces. Poor indoor environments in commercial and

institutional buildings can impact on productivity and may pose health risks to users. The design, management, operation and maintenance of buildings should seek to provide a good quality indoor environment, but with optimum use of energy and other resources.

BETA 0

7 Health and Wellbeing**7 Prerequisite****HWB P1 Minimum Ventilation Performance**

Extent of Application All buildings.

Objective Assess the quality of on-site outdoor air and demonstrate that a minimum quantity of outdoor air is supplied to all regularly occupied spaces in the project in order to safeguard the health and comfort of building users.

Credit Requirement

- (a) Measure outdoor air pollutants on-site prior to building design to understand the *site* conditions.
- (b) Demonstrate the project is in compliance with the minimum ventilation quantity with respective to its designed ventilation mode.

Assessment**(a) On-site outdoor air quality**

Engage an inspection body [1] accredited by Hong Kong Accreditation Service (HKAS) to measure the quality of outdoor air. Measurements should be taken for the following outdoor air pollutants:

- 1) Carbon monoxide (CO)
- 2) Nitrogen dioxide (NO₂)
- 3) Ozone (O₃); and
- 4) Respirable suspended particulates (PM₁₀)

Report from accredited inspection bodies for indoor air quality inspection is acceptable.

One sample should be taken at the centre of the *site*. If emission sources, which are under operation by the time the measurement is taken, are present in the immediate surroundings of the project *site*, additional samples should be taking at locations facing the sources. The examples of emission sources can be found in the EPD's website [2].

Representative locations are acceptable if there is accessibility issue. The samples should be taken when no construction activities were on-going on the day of measurement. All parameters at one sampling location should be taken on the same day.

Prepare a narrative to benchmark the measurement results against the below acceptance limits. Note that the measurement results are not required to comply with the limits and should be served as design information only. The measurement results should be signed off by the representative of the project owner and the Building Services Engineer.

1 Innovation and Technology Commission, Hong Kong Accreditation Service (HKAS), Accredited Organisations and Inspection Bodies [ONLINE] Available at: www.itc.gov.hk/en/quality/hkas/doc/common/accrorg/ib_field_en.pdf [Accessed 11 July 2017]

2 Environmental Protection Department – Hong Kong Air Pollutant Emission Inventory, 2017. [ONLINE] Available at: http://www.epd.gov.hk/epd/english/environmentinhk/air/data/emission_inve.html [Accessed 05 July 2017].

Parameter	8-hour average acceptance limit [3]
Carbon monoxide (CO)	<10,000 µg/m ³ or <8.7 ppmv
Nitrogen dioxide (NO ₂)	<150 µg/m ³ or <80 ppbv
Ozone (O ₃)	<120 µg/m ³ or <61 ppbv
Respirable suspended particulates (PM ₁₀)	<180 µg/m ³

Due to *site* constraints, it may not be practicable to take 8-hour continuous measurement. In these circumstances, surrogate measurement (i.e. an intermittent measurement strategy based on the average of half-an-hour measurements conducted at four time-slots) is also accepted.

(b) Minimum ventilation

Prepare a schedule of all spaces present in the building. Categorise the spaces into normally occupied, not normally occupied and unoccupied according to the space type matrix in Appendix 9 of this Manual.

Specify the system (mechanical or natural) used to ventilate the spaces.

Spaces with significant indoor air pollution sources such as toilets, car park, refuse room and plant room are excluded from the assessment. Staircases are also excluded.

Demonstrate compliance with the below criteria.

2.1 Mechanical ventilation spaces

Provide a report demonstrating compliance with the minimum ventilation rate stipulated in ASHRAE Standard 62.1-2016 [4] in all *normally occupied spaces*.

2.2 Natural ventilation spaces

Select one of the following paths. The Applicant is not limited to adopt only one path for all the spaces.

Prescriptive path

For *residential buildings*:

For *normally occupied spaces*, the total area of the windows / primary openings provided in each space is not less than 7% of the floor area of the space. Refer to Cap. 123F Building (Planning) Regulations [5] for the requirements for windows or PNAP APP 130 [6] for the definition of primary openings.

3 Environmental Protection Department – IAQ Certification Scheme 2017. [ONLINE] Available at: <http://www.iaq.gov.hk/en/iaq-certification-scheme.aspx> [Accessed 05 July 2017].

4 American Society of Heating Refrigeration and Air Conditioning Engineers – ANSI/ASHRAE Standard 62.1-2016 Ventilation for Acceptable Indoor Air Quality

5 Building (Planning) Regulations Cap. 123. Hong Kong e-Legislation. [ONLINE] Available at: <https://www.elegislation.gov.hk/hk/cap123F> [Accessed 05 July 2017].

6 Buildings Department – APP-130 Lighting and Ventilation Requirements – Performance-based Approach. [ONLINE] Available at: <http://www.bd.gov.hk/english/documents/pnap/APP/APP130.pdf> [Accessed 05 July 2017].

If cross ventilation is provided as per PNAP APP 130, the aggregated size of the primary openings should not be less than 2.2% of the floor area of the room; the aggregated size of the secondary openings should not be less than 2.2% of the floor area of the room.

For non-residential buildings:

Provide a report demonstrating compliance with section 6.4 Natural Ventilation Procedure stipulated in ASHRAE Standard 62.1-2016 in all *normally occupied spaces*.

Performance path

For *normally occupied spaces*, the ventilation rate meets 1.7 ACH under one annual prevailing wind direction with the highest wind frequency. The annual wind rose (wind probability table) at 400 and 31 in Building (Planning) Reg.

Wind data, such as wind frequency, wind rose, wind profile should be adopted from the appropriate and reliable sources, such as simulated *site* wind data based on appropriate mathematical models, such as RAMS from PlanD [7] or experimental *site* wind data from *wind tunnel* test.

Ventilation performance should be demonstrated using *wind tunnel* tests, computational fluid dynamics or approaches that range from simple single zone models to elaborate multi-zone models [8].

The below requirements should be fulfilled in the *CFD* simulation:

- 1) Surrounding buildings and terrain shall be included in the model based on the GIS information from Lands Department, the Government of HKSAR [9];
- 2) The surrounding area shall be at least, 2H (H being the building height (m) of the tallest building on the project *site*) or 200m away from the project *site* boundary, whichever is larger. The buildings within the surrounding area can be simplified to block;
- 3) The terrain area shall be in a size of at least, 10H (H being the building height (m) of the tallest building on the project *site*) or 1000m × 1000m, whichever is larger, with the project placed in the centre; and
- 4) Buoyancy and turbulence driven flows need not be considered.

Prepare a Natural Ventilation Report including the following contents:

- 1) Summary of naturally ventilated spaces highlighting compliance
- 2) All assumptions made
- 3) Methodology
- 4) Results

The Natural Ventilation Report should be endorsed by Hong Kong professional institution qualified holder who has at least 5 years of relevant experience in natural ventilation design and CFD modelling.

(b) Related Credits**HWB 4 Ventilation**

The related credit awards project demonstrating enhanced ventilation performance in *normally occupied spaces* and not *normally occupied spaces*.

HWB 8 Indoor Air Quality

Carrying out on-site outdoor analysis provides useful information for the selection of selecting ventilation means and ventilation system design in order to achieve satisfactory indoor air quality. From the measurement result, a proper design to ensure a good air quality provision could help gaining credit points in HWB 8.

7 Health and Wellbeing 7.1 Design for Green Living

HWB 1 Healthy and Active Living

Extent of Application	Indoor / semi-outdoor communal areas of building development.
Objective	To encourage designing building environment for healthy and active living by improving living and / or working experience of building users and integrating physical activities in the design for an active lifestyle.
Credits Attainable	1 BONUS
Credit Requirement	1 BONUS credit for scoring at least 75% of all applicable design measures for healthy and active living.
Assessment	<p>Provide a report demonstrating compliance of at least 75% of all relevant applicable design measures for healthy and active living as listed below, item (i) to (xiv):</p> <p><u>Improving living and / or working experience of communal use by building occupants</u></p> <ol style="list-style-type: none"> 1) Integration of public art in indoor communal areas at the building main entrance and core circulation lobbies at main access level to have at least one artwork respectively. The public artwork should be of scale reasonably proportional to space/ venue it locates. A narrative or infographics of the art piece should also be available for users and visitors. <p><u>Integrating physical activities in the design for an active lifestyle</u></p> <ol style="list-style-type: none"> 2) Install way-finding signage and info graphics at point-of-decision to encourage stair use (at least one at the building main entrance and all core circulation lobbies with lift provisions). 3) Install at least one (1) circulation stair in communal area meeting the following requirements: <ul style="list-style-type: none"> - Riser to be not more than 150mm and tread to be at least 300mm; - Individual flight of stair not to exceed 1800mm nor a total of more than 12 risers; - Placed visually before lifts upon entering the building main entrance, - Connecting at least three (3) storeys; and - Stair width to be at least 1350mm. 4) Install at least one (1) provision for physical activities in communal areas, for example exercise stations, jogging tracks, cycling etc.

Additional or alternative design features may be included. Justification on achievement in credit objectives should be demonstrated. Such proposed

design feature will be taken as one of the total applicable design measures in denominator calculation.

Remarks

(a) Additional Information

None.

(b) Related Credits

SS 1 Pedestrian-oriented and Low Carbon Transport

The related credit promotes providing cycling facilities within the *Site* and integrating with the public cycling network if a public cycling network exists or has been planned nearby. Changing/ shower facilities for non-residential buildings are required to achieve the credit.

SS 2 Neighbourhood Amenities

The related credit encourages building developments to have adequate amenities for its users within or in the vicinity of the *Site*. When relevant amenities are counted in SS 2a, they would not be applicable for HWB 2.

7 Health and Wellbeing

7.1 Design for Green Living

HWB 2 Biophilic Design

Extent of Application

All buildings.

Objective

To encourage building occupants to have constant interaction with living things and natural surroundings to nurture the innate human-nature connection and to address human psychological need to be around life and life-like processes.

Credits Attainable

2 BONUS

Credit Requirement

1 BONUS credit for demonstrating visual connection with nature and/ or *biophilic design* features at an assessment space with Visual Quality Score of 2 or above.

1 additional BONUS credit for demonstrating visual connection with nature and/ or *biophilic design* features at an assessment space with Visual Quality Score of 3 or above.

Assessment

1. Visual Quality (VQ) can be described by identifying the inherent characteristics and attributes of the surrounding environment. This includes the identification of elements that have both positive and negative contributions.
2. The Visual Quality Study under this credit should address the visual connection with nature and/ or *biophilic design* features at an assessment space meeting the following requirements.
3. The assessment space chosen shall be a *normally occupied space* with highest occupancy within the development. If *biophilic design* is not practical for the *normally occupied space* with the highest occupancy due to particular operational requirements, the Applicant can provide evidence to justify the difficulty and propose the use of the *normally occupied space* of the second highest occupancy for the assessment.
4. A demarcation plan of the *normally occupied spaces* for assessment and the justification of the highest occupancy within the development based on relevant building codes shall be provided.
5. Images taken from the viewpoints should be analysed based on a weighting factor of 1 to 5 to indicate the quality of the view. The weighting factors are listed in the following table:

Table HWB 2-1

Weighting factor	Representation	Visual connection to nature and/ or <i>biophilic design</i> features

5	Outstanding	Natural terrain; waterfront; extensive outdoor greenery with deciduous trees, seasonal flowers and/or native plants providing local fauna, including birds and butterflies with appropriate food sources and habitats
4	Excellent	Outdoor planting; sky
3	Good	Indoor planting
2	Fair	Biomorphic forms & patterns; nature presented by digital medium, drawings or other visual means
1	insignificant	No visual connection to the above

6. The Applicant shall produce images from the viewpoints using viewpoint in 3D model at PA stage and single lens camera at FA stage. The specifications for camera or 3D model are as follows:

6.1 Viewpoint in 3D Model at PA stage:

Option 1:

Vertical elevation of camera for viewpoints in 3D model	1,600mm above ground/ finished floor
Vertical upward angle	25°
Vertical downward angle	35°

Option 2:

Vertical elevation of camera for viewpoints in 3D model	1,600mm above ground/ finished floor
Equivalent lens focal length or focal length	27mm

6.2 Single Lens Camera at FA stage:

Vertical elevation of camera	1,600mm above ground/ finished floor
Equivalent lens focal length or focal length	27mm
Aspect Ratio	3:2

6.3 Important notes:

- 1) No fisheye or image distortion before or after picture taking; and
- 2) No zooming or pan function shall be used.

6.4 Number and location of viewpoints:

- 1) A minimum of ONE viewpoint shall be placed within the selected assessment space, and
- 2) The viewpoint should be appropriately located at the centre of the assessment space (for space of irregular shape, the space shall be subdivided into various notional portions for respective VQS_{portion} calculations and the VQS_{portion} of various portions shall be area-weighted based on their areas to compute the overall VQS of the assessment space).

6.5 Number of Frames:

- 1) A series of frames from 3 different directions at 45° interval should be taken using landscape *orientation*.

6.6 Methodology:

- 1) For each frame, assign weighting factors from 1 to 5 to different portions of the frame depending on the quality of the view;
- 2) Calculate the Visual Quality Score of the frame using Area Weighting Methodology;
- 3) Repeat the process for each frame; and
- 4) Calculate the average Visual Quality Score for the viewpoint.

6.7 Primary Tools:

- 1) 3D model using any appropriate 3D visualisation software at PA stage
- 2) Physical photographs taken from the *site* at FA stage

6.8 Basic Demonstration:

Using a camera, the following view angle was set, and taken 3 views at 45° interval. Frame 1A, taken from Viewpoint A, has:

- 1) 35% of the area that are outside natural terrain view;
- 2) 25% of the area that are indoor green wall; and
- 3) 40% of the area that are wall and furniture.

(b) Related Credits**SS P1 Minimum Landscaping Requirements**

The related prerequisite requires minimum *site* coverage of greenery and minimum provisions for viability of planting, for example, the minimum soil volumes and depths for all plant areas.

SS 2 Neighbourhood Amenities

The related credit encourages building developments to have adequate amenities for its users within or in the vicinity of the *Site*. When relevant amenities are counted in SA 2a, they would not be applicable for HWB 2.

SS 7 Ecological Preservation / Enhancement

The related credit encourages preservation of ecological resources and

interconnects with adjacent areas of high ecological value.

SS 8 Urban Heat Island Mitigation

The related credit encourages higher overall *site* coverage of greenery.

HWB 1 Healthy and Active Living

The related credit encourages urban farm as a means to improve the living and / or working experience of building occupants.

BETA 0

7 Health and Wellbeing 7.2 Inclusive Design

HWB 3 Inclusive Design

Extent of Application	All buildings.
Objective	Encourage well integrated weather protection and user-friendliness in the building design for outdoor or semi-outdoor communal / private space design at various levels of a building.
Credits Attainable	1 + 1 BONUS
Credit Requirement	<p>(a) Universal Accessibility 1 credit for providing at least ten (10) applicable enhanced provisions as stipulated in the “Recommended Design Requirements” of BFA 2008.</p> <p>(b) Weather protection and family friendly features 1 BONUS credit for providing prescribed weather protection and at least two (2) family friendly facilities features.</p>
Assessment	<p>(a) Universal Accessibility Provide a report detailing at least ten (10) applicable enhanced provisions as stipulated in the “Recommended Design Requirements” of BFA 2008” [1].</p> <p>(b) Weather protection & Family Friendly Facilities Provide weather protection features against wind-driven rain for all covered semi-outdoor communal areas within the building, allowing a minimum width of 2 m protected zone from driving rain.</p> <p>Minimum driving rain angles (MRA) from edges of rain protection features shall be calculated based on the following equation: $\text{MRA} = \tan^{-1} (u / 4.5 I^{0.107})$ Where, u = Hourly mean wind speed affecting the rain (m/s) I = Intensity of rainfall (mm/hr)</p> <p>A default figure of 30 mm/hr is taken as the hourly rainfall intensity under heavy rain conditions (Hong Kong Observatory defines “heavy rain days” as days with hourly rainfall greater than 30 mm).</p> <p>Wind speed can be determined from the wind profile diagram available at PlanD’s <i>Site Wind Data</i> webpage [2]. For a semi-external communal space facing a certain <i>orientation</i>, the wind profile for that <i>orientation</i> at its proposed location (height above ground) shall be used.</p>

Family Friendly Facilities:

- 1) At least one shaded rest areas with seating for care-takers near play equipment for children. This accounts for 1 inclusive design feature.
- 2) At least one water closet for children or family in each male and female or stand-alone toilet with seat height in the range of 310 mm to 380 mm for communal use. This accounts for 1 inclusive design feature.
- 3) At least one baby-care facilities / breast feeding room in the communal areas of the building. This accounts for 1 inclusive design feature.

Additional or alternative inclusive design features may be included, which achievement in credit objectives should be demonstrated.

SS 1 Pedestrian-oriented and Low Carbon Transport

The related credit promotes convenient and barrier-free pedestrian environment in *site* planning of the outdoor spaces.

BETA 0

7 Health and Wellbeing 7.3 Indoor Environmental Quality

HWB 4 Enhanced Ventilation

Extent of Application All buildings.

Objective Maintain effective ventilation and prevent exposure to concentrated indoor pollutant sources to support occupants' health and wellbeing.

Credits Attainable 3 + 1 BONUS

Credit Requirement (a) Fresh Air Provision

1.1 Fresh air provision in normally occupied spaces

1 credit for demonstrating that all *normally occupied spaces* in the building are provided with increased ventilation.

1.2 Fresh air provision in not normally occupied spaces

1 credit for demonstrating that all not *normally occupied spaces* in the building are provided with adequate ventilation.

1.3 On-site measurements

1 BONUS credit for conducting on-site measurements to verify the ventilation performance for all *normally occupied spaces*.

(b) Exhaust Air

1 credit for the provision of an effective ventilation system for spaces where significant indoor pollution sources are generated.

Assessment (a) Fresh Air Provision

Prepare a schedule of all spaces present in the building. Categorise the spaces into normally occupied, not normally occupied and unoccupied according to the space type matrix in Appendix 9 of this manual.

Specify the system (mechanical or natural) used to ventilate the spaces.

Spaces with significant indoor air pollution sources such as toilets, car park, refuse room and plant room are excluded from the assessment. Staircases are also excluded.

1.1 Fresh air provision in normally occupied spaces

Demonstrate compliance with the below criteria.

1.1.1 Mechanical ventilation spaces

Provide a report demonstrating compliance with the minimum ventilation rates stipulated in ASHRAE Standard 62.1-2016 [1] in all *normally occupied spaces* is exceeded by at least 30%.

1.1.2 Natural ventilation spaces

Select one of the following paths. The Applicant is not limited to adopting only one path for all the spaces.

1 American Society of Heating Refrigeration and Air Conditioning Engineers – ANSI/ASHRAE Standard 62.1-2016 Ventilation for Acceptable Indoor Air Quality

a) Prescriptive path1. For *residential buildings*:

For *normally occupied spaces*, the total area of the windows / primary openings provided in each space is not less than 9% of the floor area of the space. Refer to Cap. 123F Building (Planning) Regulations for the requirements for windows or PNAP APP 130 [2] for the definition of primary openings.

If cross ventilation is provided as per PNAP APP 130, the aggregate size of the primary openings should not be less than 2.5% of the floor area of the room; the aggregate size of the secondary openings should not be less than 2.5% of the floor area of the room.

2. For *non-residential buildings*:

For *normally occupied spaces*, the openable area should be not less than 5.2% (exceed 4%, as stipulated in ASHRAE 62.1 – 2016 Section 6.4.2, by 30%) of the net occupiable floor area.

b) Performance path

For *normally occupied spaces*, the ventilation rate meets 2.2 ACH under one annual prevailing wind direction with the highest wind frequency. The annual wind rose (wind probability table) at 400 – 600m of the *site* should be used.

Wind data, such as wind frequency, wind rose, wind profile should be adopted from the appropriate and reliable sources, such as simulated *site* wind data based on appropriate mathematical models, such as RAMS from PlanD [3] experimental *site* wind data from *wind tunnel* test.

Ventilation performance should be demonstrated using *wind tunnel* tests, computational fluid dynamics or approaches that range from simple single zone models to elaborate multi-zone models [4].

The below requirements should be fulfilled in the *CFD* simulation:

- i. Surrounding buildings and terrain shall be included in the model based on the GIS information from Lands Department, the Government of HKSAR;
- ii. The surrounding area shall be at least, 2H (H being the building height (m) of the tallest building on the project *site*) or 200m away from the project *site* boundary, whichever is larger. The buildings within the surrounding area can be simplified to block;
- iii. The terrain area shall be in a size of at least, 10H (H being the building height (m) of the tallest building on the project

2 Buildings Department – APP-130 Lighting and Ventilation Requirements – Performance-based Approach. [ONLINE] Available at:

<http://www.bd.gov.hk/english/documents/pnap/APP/APP130.pdf>. [Accessed 05 July 2017].

3 Site Wind Availability System. 2017. [ONLINE] Available at:

http://www.pland.gov.hk/pland_en/info_serv/site_wind/site_wind/index.html. [Accessed 05 July 2017].

4 American Society for Testing Materials. ASTM E 2267-03. Specifying and Evaluating Performances of Single Family Attached and Detached Dwellings – Indoor Air Quality. 2003.

site) or 1000m × 1000m, whichever is larger, with the project placed in the centre; and

- iv. Buoyancy and turbulence driven flows need not be considered.

Prepare a Natural Ventilation Report including the following content:

- i. Summary of naturally ventilated spaces highlighting compliance
- ii. All assumptions made
- iii. Methodology
- iv. Results

The Natural Ventilation Report should be endorsed by a Hong Kong professional institution qualified engineer who has at least 5 years of relevant experience in natural ventilation design and *CFD* modelling.

1.2 Fresh air provision in not *normally occupied spaces*

1.2.1 Mechanical ventilation spaces

Demonstrate compliance with the minimum ventilation rates stipulated in ASHRAE Standard 62.1-2016 in all not *normally occupied spaces*.

1.2.2 Natural ventilation spaces

Demonstrate the ventilation rates in all not *normally occupied spaces* meets 1.7 ACH. Methodology should follow the performance route for part (a) (1).

1.3 On-site measurements

Part (a) (1.1) is a prerequisite of part (a) (1.3), such that this BONUS credit will be granted only if the credits in part (a) (i) have been achieved.

Prepare a measurement protocol which includes the proposed measurement locations and methodology.

1.3.1 Mechanical ventilation spaces

Demonstrate, by measurement, the required amount of outdoor air corresponding to the design outdoor air flow rate is provided. Accepted measurement methods include the followings:

- a) ASHRAE 111 [3]
- b) Tracer gas techniques in accordance with ASTM E 741[4]

At least one sampling point should be present in each *normally occupied space* usage.

3 American Society of Heating Refrigeration and Air Conditioning Engineers – ANSI/ASHRAE Standard 111-2008
Measurement, Testing, Adjusting and Balancing of Building HVAC Systems

4 ASTM International – ASTM E471-11 Standard Test Method for Determining Air Change in a Single Zone by Means of a Tracer Gas Dilution

If the measurement results demonstrate unmet requirement in part (a) (i), the credit in both part (a) (1.1) and part (a) (1.3) will be not be awarded

1.3.2 Natural ventilation spaces

Demonstrate, by measurement, the design ACH is achieved. Tracer gas decay test in accordance with ASTM E 741 is an accepted measurement method.

At least one sampling point should be present in each *normally occupied space* type. For each *normally occupied space* usage, the sampling locations should cover all orientations and low, mid and high floors.

If the measurement results demonstrate unmet requirement in part (a) (1.1), the credit in both part (a) (1.1) and part (a) (1.3) will be not be awarded.

(b) Exhaust air

Provide design criteria that have been adopted and the details of the ventilation system designs providing local exhaust where concentrated pollutant sources are likely to be present. ASHARE Standard 62.1 – 2016 and CIBSE Guide B 2016 [5] are accepted references for this credit.

Submit exhaust air rate calculation demonstrating the compliance of design criteria and equipment specifications.

	Assessment	<p>(a) Room Acoustics</p> <ol style="list-style-type: none"> 1) Demonstrate that mid-frequency reverberation time in applicable rooms of landlord's controlled area meets the below criteria of different types of premises. 2) Demonstrate that mid-frequency reverberation time in applicable rooms of tenanted area meets the below criteria of different types of premises. <p>Criteria</p> <p>The average reverberation time for mid frequencies (500Hz, 1kHz and 2kHz) and noise assessment criterion, should be:</p> <ol style="list-style-type: none"> 1) Office type premises: 0.4 to 0.6s 2) Classrooms and similar premises: 0.4 to 0.6s 3) Residential premises, hotels and apartments: 0.4 to 0.6s 4) Indoor games halls, indoor swimming pools: 1.5 to 2s 	

- 5) Common areas in shopping malls:
- a) Average reverberation time for mid frequencies between 1.0 to 1.5s, or
 - b) Noise reduction coefficient (NRC) for ceiling at mid frequencies ≥ 0.7

Based on the nature of the building, alternative appropriate criteria with sufficient justification and evidence provided by the applicant will be allowed. Approval is required for the alternative proposal.

Compliance should be demonstrated by detailed calculations or measurements depending on the applicant's preference. The acoustic calculation or measurement report should be endorsed by a Corporate Member of Hong Kong Institute of Acoustics or equivalent.

The assessment shall include at least one sample of each type of *occupied space*.

The reverberation time shall be assessed using Sabine's formula [1] or similar alternative taking into account the room details and appropriate assumptions about the materials in the space. Measurements during commissioning shall use the method given in ISO 3382 [2] or equivalent.

For buildings without the abovementioned spaces, with no spaces where speech intelligibility is important, or with rooms of a special acoustical nature, submit a schedule of spaces present in the building and relevant justifications for this credit to become not applicable.

(b) Noise Isolation

- 1) Demonstrate airborne noise isolation between, spaces fulfils the prescribed criteria.

Criteria

Compliance should be demonstrated by computer simulation, detailed calculations, or measurements depending on the Applicant's preference. The performance of the weighted Sound Reduction Index (SRI) or Level Difference should fulfil the requirements as stated in the blow table. The computer simulation report, acoustic calculations or the measurement report should be endorsed by a Corporate Member of Hong Kong Institute of Acoustics or equivalent.

1 I.Sharland. Woods practical guide to noise control. Colchester, England

2 International Standard Organization – ISO 3382:2009 - Acoustics -- Measurement of room acoustic parameters.

Type of Premises	Weighted SRI	Level Difference
Between offices/ conference rooms/ retail shops	R_w 44	$D_{nT,w}$ 38
Between hotel rooms/ serviced apartments/ function rooms/ activity rooms	R_w 52	$D_{nT,w}$ 46
Between classrooms	R_w 37	$D_{nT,w}$ 31
Between bedrooms to living rooms (same unit)	R_w 46	$D_{nT,w}$ 40
Between bedroom to bedroom/ living room to living room (different units)	R_w 52	$D_{nT,w}$ 46
Between bedroom to bedroom (same unit)	R_w 44	$D_{nT,w}$ 38

Based on the nature of the building, alternative appropriate criteria with sufficient justification and evidence provided by the applicant will be allowed.

The criteria apply to partition walls which are actually provided and potentially provided by the landlord.

For buildings without the abovementioned spaces, with no spaces where speech intelligibility is important, or with rooms of a special acoustical nature, submit a schedule of spaces present in the building and relevant justifications for this credit to become not applicable.

- 2) Demonstrate impact noise isolation between floors fulfills the below criteria.

Demonstrate the following by computer simulation or measurements depending on the Applicant's preference.

Type of Premises	Weighted Normalised Impact Sound Pressure Level (by laboratory)	Weighted Normalised Impact Sound Pressure Level (On site measurement)
Floors separating sole-occupancy units, or a sole-occupancy unit from a plant room, lift shaft, stairway, public lobby or the like, or parts of a different classification	$L_{n,w}$ 64	$L'_{n,w}$ 70

Submit a schedule of the spaces in the building, the noise isolation criteria adopted, relevant partition or slab details as they impact on noise isolation, the rooms/ premises subject to field tests or for which detailed calculations or simulations have been made, underlying assumptions, and the results of tests of calculations or simulations demonstrating compliance with the criteria.

(c) Background Noise

Demonstrate the background noise levels from both external sources and building services equipment are within the below criteria.

Criteria

Internal noise level (NR and NC value should be consistently used in the project):

- 1) Office type premises: NR/NC 40
- 2) Classrooms and similar premises: NR/NC 35
- 3) Residential premises, hotel and apartments: NR/NC 35
- 4) Common areas in shopping malls: NR/NC 45
- 5) Indoor games halls & Indoor swimming pools: NR/NC 50

Based on the nature of the building, alternative appropriate criteria with sufficient justification and evidence provided by the applicant will be allowed.

Compliance should be demonstrated by detailed calculations or measurements depending on the applicant's preference. The acoustic calculation or measurement report should be endorsed by a Corporate Member of Hong Kong Institute of Acoustics or equivalent.

Internal noise calculations or *site* measurements should include at least one sample of each type of *occupied space*, taking account into the worst case condition of exposure to noise sources external to the space, and undertaken during periods appropriate to the usage pattern for the space. Measuring equipment shall conform to the accuracy requirements given in IEC 61672-1 [3] Class 1 requirements, or equivalent.

The assessment should take into account noise from building services equipment under normal operation mode. For residential units, the assessment should only consider the external noise sources.

For buildings without the abovementioned spaces, with no spaces where speech intelligibility is important, or with rooms of a special acoustical nature, submit a schedule of spaces present in the building and relevant justifications for this credit to become not applicable.

7 Health and Wellbeing 7.3 Indoor Environmental Quality

HWB 8 Indoor Air Quality

Extent of Application

All buildings for parts (a) and (c)
All buildings with enclosed and/or semi-enclosed car park of areas more than 10% of Construction Floor Area for part (b).

Objective

Demonstrate that airborne contaminants do not give rise to unacceptable levels of air pollution in the building

Credits Attainable

4 + 2 BONUS

Credit Requirement

(a) Indoor air quality in occupied spaces

1.1 Path 1

1 credit for demonstrating compliance with the prescribed limits for Carbon monoxide (CO), Nitrogen dioxide (NO₂), Ozone (O₃) in the sampled occupied spaces.

1 credit for demonstrating compliance with the prescribed limits for Carbon dioxide (CO₂), Total volatile organic compounds (VOCs), Formaldehyde (HCHO) and Radon (Rn) in the sampled occupied spaces.

1 credit for demonstrating compliance with the prescribed limits for Airborne bacteria in the sampled occupied spaces.

1.2 Path 2

3 credits for submitting a valid IAQ Certification Scheme (Good Class) certificate issued by the Environmental Protection Department (EPD) covering the whole building.

1.3 Path 3

3 credits and 1 BONUS credit for submitting a valid IAQ Certification Scheme (Excellent Class) certificate issued by the Environmental Protection Department (EPD) covering the whole building.

(b) Air quality in car park

1 credit for demonstrating compliance with the pollutant concentration limits specified in ProPECC PN 2/96.

(c) Mould prevention and control

1 BONUS for adopting mould prevention and control strategies.

Assessment

(a) Indoor air quality in occupied spaces

1.1 Path 1

Prepare a measurement protocol prepared by a IAQ Certificate Issuing Body (CIB) [1] following guidance stated in Step 1 – Step 4 in A Guide on Indoor Air Quality Certification Scheme for Offices and Public Spaces [2].

Measurements should be taken in occupied spaces (including *normally occupied spaces* and *not normally occupied spaces*) and the limits are specified below.

At least one sampling point should be present in each space usage.

Parameter	8-hour average acceptance limit [3]
Carbon dioxide (CO ₂)	<1,000 ppmv
Carbon monoxide (CO)	<10,000 µg/m ³ or <8.7 ppmv
Nitrogen dioxide (NO ₂)	<150 µg/m ³ or <80 ppbv
Ozone (O ₃)	<120 µg/m ³ or <61 ppbv
Respirable suspended particulate (PM ₁₀)	<180 µg/m ³
Total volatile organic compounds (TVOC)	<600 µg/m ³ or <261 ppbv
Formaldehyde (HCHO)	<100 µg/m ³ or <81 ppbv
Radon (Rn)	<200 Bq/m ³
Airborne bacteria	<1,000 cfu/m ³

Given the floor plan of the building has not been changed, the sampling points agreed during Provisional Assessment will remain the same for Final Assessment. Otherwise, if the floor plan has been undergone major change, the sampling points will be re-assessed during Final Assessment.

1.2 Path 2

Submit a valid certificate issued by the Environmental Protection Department (EPD) covering the whole building (note: it is not necessary to submit the first measurement results). The whole building should be certified by the Good Class of “Indoor Air Quality Certification Scheme for Office and Public Place”. The whole building should be fully furnished.

1.3 Path 3

-
- 1 Indoor Air Quality Information Centre – Certificate Issuing Body Accreditation. [ONLINE] Available at: <http://www.iaq.gov.hk/en/iaq-certification-scheme/certificate-issuing-body-accreditation.aspx>. [Accessed 07 July 2017].
 - 2 Indoor Air Quality Management Group – A Guide on Indoor Air Quality Certification Scheme for Offices and Public Spaces 2003. [ONLINE] Available at: <http://www.iaq.gov.hk/media/8694/certguide-eng.pdf>. [Accessed 6 July 2017]
 - 3 Indoor Air Quality Management Group – A Guide on Indoor Air Quality Certification Scheme for Offices and Public Spaces 2003. [ONLINE] Available at: <http://www.iaq.gov.hk/media/8694/certguide-eng.pdf>. [Accessed 6 July 2017]

Submit a valid certificate issued by the Environmental Protection Department (EPD) covering the whole building (note: it is not necessary to submit the first measurement results). The whole building should be certified by the Excellent Class of "Indoor Air Quality Certification Scheme for Office and Public Place". The whole building should be fully furnished.

(b) Air quality in car park

This part is only applicable to buildings with enclosed and/or semi-enclosed car park of areas more than 10% of Construction Floor Area. Area of open car park, if present in the project, should not be accounted in this percentage.

2.1 For mechanically ventilated car park:

Estimate the peak pollutant loading, including carbon monoxide (CO) and nitrogen dioxide (NO₂), in the car park.

Use the below equation to calculate the ventilation rate for both CO and NO₂. The higher ventilation rate should be adopted. Demonstrate the ACH can cater the peak pollutant loading and the CO and NO₂ concentration limits specified in ProPECC PN 2/96 [4].

Carbon monoxide (CO)

$$QF = \frac{q^{\circ}\text{CO}}{3600} D_{pc} \frac{1 \times 10^6}{\text{CO}_{lim}} \text{ (idling)}$$

$$QF = \frac{q^{\circ}\text{CO}}{3600} D_{tc} \frac{1 \times 10^6}{\text{CO}_{lim}} D(\text{travelling})$$

Nitrogen dioxide (NO₂)

$$QF = \frac{q^{\circ}\text{NO}_2}{3600} D_{pc} \frac{1 \times 10^6}{\text{NO}_{2lim}} \text{ (idling)}$$

$$QF = \frac{q^{\circ}\text{NO}_2}{3600} D_{tc} \frac{1 \times 10^6}{\text{NO}_{2lim}} D(\text{travelling})$$

Q_F = required air quantity per second (m³/s)

$q^{\circ}\text{CO}$ = basic value of CO emission per vehicle (assumed to be 120 g/hr,veh)

$q^{\circ}\text{NO}_2$ = basic value of NO₂ emission per vehicle (assumed to be 24 g/hr,veh)

CO_{lim} = maximum permissible CO concentration (mg/m³ CO)

NO_{2lim} = maximum permissible NO₂ concentration (mg/m³ NO₂)

The maximum permissible pollutant concentration is the difference between the outdoor air pollutant concentration and the maximum allowed

4 Environmental Protection Department – ProPECC PN2/96 Control of Air Pollution in Car Parks. [ONLINE] Available at: http://www.epd.gov.hk/epd/sites/default/files/epd/english/resources_pub/publications/files/pn96_2.pdf. [Accessed 6 July 2017]

concentration. The outdoor air pollutant concentration can be found on EPD's website [5].

D_{pc} = number of idling vehicles with engine running

D_{tc} = number of travelling vehicles per km = $\frac{M_{tc}}{v}$

where M_{tc} = hourly traffic volume of travelling vehicles, and v = mean driving speed of vehicles

Assume in the peak hour, the hourly traffic volume is the full capacity of the car park. Idling time per movement is 3 minutes. The mean driving speed is 5km/hr.

D = travelling distance (km), assumed to be the longest lane in the car park.

Demonstrate the car park satisfy the provisions requirement for CO monitoring and automatic control specified in ProPECC PN 2/96.

2.2 For naturally ventilated car park

Engage a testing laboratory accredited by HKAS [6] for on-site measurements to demonstrate the levels of CO and NO₂ are in compliance with ProPECC PN2/96. The measurement after the car park started operation, supported by a project owner's declaration letter.

(c) Mould prevention and control

Select one of the following Paths. All *normally occupied spaces* should be covered, however applicants are not limited to only one Path for all spaces.

3.1 Path 1

Demonstrate the application of mould-resistant mould resistant paint and flooring materials in *normally occupied spaces*. Non-porous flooring and wall covering materials are accepted.

3.2 Path 2

Demonstrate that the system has the capability to reach relative humidity at a level between 40% to 50% in *normally occupied spaces* by adding or removing moisture from air at peak load conditions, which is defined as the summer outdoor design conditions and full occupancy. The capability should be substantiated by psychometric chart and appropriate equipment selection. Measurements are not required.

		HWB 9	Thermal Comfort
	Extent of Application	All buildings.	
	Objective	Ensure that buildings and systems are tested practicable and the specified thermal comfort conditions can be achieved under conditions of normal occupancy and expected heat gains.	
	Credits Attainable	2 + 1 BONUS	
	Credit Requirement	<p>(a) Thermal Comfort Analysis</p> <p>2 credits for conducting thermal comfort analysis and demonstrate that <i>normally occupied spaces</i> can fulfil the thermal comfort requirements.</p> <p>(b) Thermal Comfort Measurement</p> <p>1 BONUS credit for conducting on-site measurements to verify the thermal comfort performance.</p>	
	Assessment	<p>(a) Thermal Comfort Analysis</p> <p>Submit a Thermal Comfort Report demonstrating compliance with the assessment criteria. The report should include:</p> <ol style="list-style-type: none"> 1) Scale drawing(s) depicting the building layout; 2) Screen capture of project building, surrounding building and terrain of the 3D model; and 3) Simulation assumption, results of simulations and calculations for thermal comfort. <p>The reports should be endorsed by a Hong Kong Professional Institute qualified engineer who has at least 5 years of relevant experience.</p> <p>The thermal analysis shall be undertaken using dynamic thermal modelling software. The thermal analysis should cover all <i>normally occupied spaces</i> immediately below all main roofs and flat roofs.</p> <p>In addition, for each type of ventilation means (natural ventilation, mechanical ventilation and air-conditioning, if present), indicate the highest level <i>normally occupied spaces</i> using the respective ventilation means. The thermal analysis should also cover these spaces.</p> <ol style="list-style-type: none"> 1) The modelling shall include full annual simulation using standard Hong Kong weather data [1]; 2) The modelling will include the effect of installed solar control features, e.g. glazing, internal blind, internal or <i>external shading</i> components, fabric and infiltration specifications, and site obstructions; 3) The modelling needs not include any internal gains; and 	

1 Standard Hong Kong weather data file from Energyplus. Weather Data by Region | EnergyPlus. [ONLINE] Available at: https://energyplus.net/weather-region/asia_wmo_region_2/CHN%20%20. [Accessed 07 July 2017].

- 4) Assessment can be confined to the scenarios with the highest mean monthly temperature of the hottest month only with reference to the weather data used.

1.1 Natural ventilation spaces

The spaces with natural ventilation must be equipped with operable windows / doors that can be readily opened and adjusted by the occupants. Maintenance window is not considered as operable windows. Mechanical ventilation / cooling equipment for the space shall not be provided.

Demonstrate that daily average indoor operative temperatures in *normally occupied space* meet the 80% acceptability limits for 80% of days in the hottest month. The determination of 80% acceptability limits should refer to ASHRAE 55-2013 [2].

The analysis can be based on the following assumptions:

- 1) Surrounding buildings and terrain shall be included in the model based on the GIS information from Lands Department, the Government of HKSAR [3];
- 2) The surrounding area shall be at less, 2H (H being the building height (m) of the tallest building on the project site) or 200m away from the project site boundary, whichever is larger;
- 3) The terrain area shall be in a size of at least, 10H (H being the building height (m) of the tallest building on the project site) or 1000m × 1000m, whichever is larger, with the project placed in the centre; and
- 4) For practical reasons, the geometry can be simplified as a simple block.

1.2 Mechanical ventilation spaces

Mechanical cooling equipment for the space shall not be provided, mechanical ventilation with unconditioned air may be utilised.

Demonstrate that daily average indoor operative temperatures in *normally occupied space* meet the 80% acceptability limits for 80% of days in the hottest month. The determination of 80% acceptability limits should refer to ASHRAE 55-2013.

1.3 Air-conditioned spaces

Demonstrate that the predicted Mean Vote (PMV) in *normally occupied space* is between -1 and +1. The calculation of PMV should refer to ASHRAE 55-2013.

2 American Society of Heating Refrigeration and Air Conditioning Engineers – ANSI/ASHRAE Standard 55-2013 Thermal Environmental Conditions for Human Occupancy.

3 Lands Department - Survey and Mapping Office - GIS Projects Section. 2017. Survey and Mapping Office - GIS Projects Section. [ONLINE] Available at: http://www.landstd.gov.hk/mapping/en/lic/lic_gis.htm. [Accessed 07 July 2017].

(b) Thermal Comfort Measurement

Part (a) is a prerequisite of part (b), such that the BONUS credit in part (b) will be granted only if the credits in part (a) have been achieved.

Submit a Thermal Comfort Measurement Report demonstrating compliance with the assessment criteria.

The report should include:

- 1) Sampling locations;
- 2) Measurement methodology, equipment photo and results; and
- 3) Calculations for thermal comfort.

2.1 Natural ventilation spaces

10% of the number of naturally ventilated *normally occupied spaces* included in the thermal analysis in part (a) should be sampled.

Record the main physical parameters including outdoor air temperature, indoor air temperature, indoor mean radiant temperature and indoor wind speed. The indoor mean radiant temperature can be assumed to be indoor air temperature. The measurement should take note on the following:

- 1) The measurement should not be taken on a rainy day;
- 2) The measurements should be represented as 8-hour average in the daytime;
- 3) The measurement of indoor temperature should be made with reference to the current EPD's IAQ certification scheme; and
- 4) The sensors used in the measurement survey shall have an accuracy that complies with ASHRAE 55-2013 [4], ISO 7726 [5] or equivalent.

Demonstrate that the naturally ventilated *normally occupied space* meet the 80% acceptability limits on any one day during selected hottest month from reference weather data file. The results shall demonstrate compliance with the prescribed design criteria within the prescribed limits, for a minimum of 90% of the prescribed locations.

2.2 Mechanical ventilation spaces

10% of the number of mechanically ventilated *normally occupied spaces* included in the thermal analysis in part (a) should be sampled.

Record the main physical parameters including outdoor air temperature, indoor air temperature, indoor mean radiant temperature and indoor wind speed. The indoor mean radiant temperature can be assumed to be

5 International Standard Organization – ISO 7726:1998 Ergonomics of the thermal environment — Instruments for measuring physical quantities.

indoor air temperature. The measurement should take note on the following:

- 1) The measurement should not be taken on a rainy day;
- 2) The measurements should be represented as 8-hour average in the daytime;
- 3) The measurement of indoor temperature should be made with reference to the current EPD's IAQ certification scheme [6]; and
- 4) The sensors used in the measurement survey shall have an accuracy that complies with ASHRAE 55-2013, ISO 7726:1998 or equivalent.

Demonstrate that the mechanically ventilated *normally occupied space* meet the 80% acceptability limits on any one day during selected hottest month from reference weather data file. The results shall demonstrate compliance with the prescribed design criteria within the prescribed limits, for a minimum of 90% of the prescribed locations.

2.3 Air conditioned spaces

10% of the number of air-conditioned *normally occupied spaces* included in the thermal analysis in part (a) should be sampled.

Record the main physical parameters including indoor air temperature, indoor mean radiant temperature, indoor relative humidity and indoor wind speed. The indoor mean radiant temperature can be assumed to be indoor air temperature. The measurement should take note on the following:

The measurement should not be taken on a rainy day;

- 1) The measurements should be represented as 8-hour average in the daytime;
- 2) The measurement of indoor temperature and indoor relative humidity should be made with reference to the current EPD's IAQ certification scheme; and
- 3) The sensors used in the measurement survey shall have an accuracy that complies with ASHRAE 55-2013, ISO 7726 or equivalent.

Demonstrate that the predicted Mean Vote (PMV) in *normally occupied space* is between -1 and +1. The results shall demonstrate compliance with the prescribed design criteria within the prescribed limits, for a minimum of 90% of the prescribed locations.

7 Health and Wellbeing 7.3 Indoor Environmental Quality

HWB 11 Daylight

Extent of Application Residential, office and education buildings.

Objective To achieve satisfactory daylight performance in indoor *normally occupied spaces* by considering the sufficiency of daylight illuminance and the potential risk of excessive sunlight penetration.

Credits Attainable 2

Credit Requirement 2 credits for demonstrating at least 55% of the total area of the studied *normally occupied spaces* achieves spatial Daylight Autonomy_{300/50%} (sDA_{300/50%}) and no more than 10% of the same area receives Annual Sunlight Exposure_{100,250} (ASE_{1000, 250}).

Assessment Conduct simulations to show that at least 55% of the total area of *normally occupied spaces* can receive at least 300 lux of sunlight for at least 50% of operating hours each year and no more than 10% of the same area can receive more than 1000 lux for more than 250 hours each year.

Follow IES LM-83-12 Approved Method: IES Spatial Daylight Autonomy (sDA) and Annual Sunlight Exposure (ASE). Annual sky file referencing a local climate file, such as an EnergyPlus weather format data file (*.epw) [1], should be used for the sky model. Surrounding buildings and terrain included in the model should be based on the GIS information from Lands Department [2]. The following simplifications are allowed:

- 1) The presence trees can be ignored;
- 2) The overall external reflectance of the building can be assumed to be 0.2;
- 3) If furniture layout is not known by the time of design, it can be assumed that no furniture is in the space or a typical furniture layout can be applied; and
- 4) Internal doors within a unit are assumed to be fully opened.

Submit a Daylight Analysis Report demonstrating compliance with the credit requirement. The report shall include:

- 1) Scale drawing(s) depicting the building layout;
- 2) Screen Capture of project building, surrounding building and terrain of the 3D model; and

1 Standard Hong Kong weather data file from Energyplus. Weather Data by Region | EnergyPlus. [ONLINE] Available at: https://energyplus.net/weather-region/asia_wmo_region_2/CHN%20%20. [Accessed 07 July 2017].

3) Simulation assumption and results.

Endorsement by a Hong Kong Professional institute qualified engineer who has at least 5 years of relevant experience in daylight study.

A software validation report from the software developer should be provided to ensure the accuracy of simulation by the software.

8 Innovations and Additions**8.1 Innovations and Additions****Introduction**

BEAM Encourage innovative and/or new techniques that are yet to find mainstream application in Hong Kong addressing sustainability objectives for new buildings.

Background

Any credits gained under this heading shall be regarded as 'Bonus' credits, counting towards the total credits obtained, but not towards the total credits obtainable. BEAM encourages application of new practices, technologies and techniques and the associated benefits in addressing sustainability objectives for new buildings.

BETA 0

8 Innovations and Additions**8.1 Innovations and Additions****IA 1 Innovations and Additions**

Extent of Application All buildings, for innovations that have not been addressed in respective categories of the NB certification tool.

Objective Encourage innovative and/or new techniques that are yet to find mainstream application in Hong Kong addressing sustainability objectives for new buildings.

Credits Attainable Maximum 10 BONUS credits for IA.

Assessment Present evidence of the application of new practices, technologies and techniques and the associated benefits in addressing sustainability objectives for new buildings:

- 1) Identify the sustainability objectives addressed by the proposed innovative applications.
- 2) Detail the method and criteria evaluating the benefits and effectiveness of the applications (quantifiable performance indicators to be proposed if applicable).
- 3) Justify the number of bonus credits for the proposed applications.
- 4) Provide evidence of the implementation of the applications.
- 5) Evaluate preliminary achievements and any suggestion for improvement for the applications.

The Assessor will refer the proposal to the BSL Technical Review Committee who will consider each application on its merits.

9 Appendices

(will be arranged in alphabetical order once Finalised)

9.1 Glossary**Construction Waste**

It means any substance, matter or thing which is generated as a result of construction work and abandoned whether or not it has been processed or stockpiled before being abandoned. It is a mixture of surplus materials arising from *site* clearance, excavation, construction, refurbishment, renovation, demolition and road works.

Demolition waste means all wastes (including recyclable waste) generated from deconstruction of existing buildings at the demolition stage are counted as demolition waste.

Designed for Disassembly

Materials which can be disassembled by using non-specialist tools and for *reuse*, recycling or reprocessing

Embodied Energy

Embodied energy is the energy used during the entire life cycle of a product, including its manufacture, transportation, and disposal, as well as the inherent energy captured within the product itself

FSC Certification

A certification system for timber products which confirms that timber has been harvested in a sustainable manner.

Global Warming Potential

GWP provides a measure of the potential for damage that a chemical has relative to one unit of carbon dioxide, the primary greenhouse gas

Hydro-chlorofluorocarbons

HCFCs cause ozone depletion when released into the atmosphere.

Hydro-fluorocarbons

HFCs are commonly used to replace HCFC refrigerants to reduce the OPD, however HFCs refrigerants have a high GWP.

Modular Component

Materials which are manufactured with standardized dimensions, and can be arranged or fitted together in various scenarios of design.

Ozone Depleting Potential

ODP of a chemical compound is the relative amount of degradation to the ozone layer it can cause.

Rapidly Renewable Materials

Planted and harvested in less than a 10-year cycle, and do not result in significant biodiversity loss, increased erosion, or air quality impacts.

Recycle Content

With reference to ISO 14021, recycle content is defined as the proportion, by mass, of the recycled material in a product.

Regional Materials

Materials which are extracted and manufactured within an 800km radius of HKSAR by road transportation; within a 1,600km radius by rail transportation; or within a 4,000km radius by sea transportation.

Reuse

Materials which can be used again with the same functions as their original use.

Sustainable Forestry Product

Timber or timber products are originally sourced from forestlands participating in an acceptable system or program which certifies sustainable forest management.

Non-renewable resource

A resource does not renew itself at a sufficient rate for sustainable extraction in meaningful human time-frames.

Intermediate waste recycling facility

IWF means waste recycling facility located within 60m walking distance from an external entrance of a low-rise domestic house.

Sub-structure

Substructure is the part of the structure which is below ground level or supporting *superstructure* loads, such as foundation and basement.

Superstructure

Superstructure is the part of the structure which is above ground level, and which serves the purpose of its intended use.

Pulverised Fuel Ash (PFA)

PFA is a by-product from power plant as a partial replacement for cement in concrete.

Ground Granulated Blast Furnace Slag (GGBS)

GGBS is a by-product of the iron manufacturing industry that, after the molten iron is tapped off, the remaining molten slag (consisting of mainly siliceous and aluminous residue) is then water-quenched rapidly, dried and ground to the required size.

Primary zone

The 15m vertical zone of a *site* along the abutting street level. The greenery in this zone is for providing visual contacts or access from a street through common parts of the building for enhancing the walkability of urban space to the public, visitors or occupiers. The top level of soil or similar base for planting should be taken as the reference level for inclusion in the Primary Zone.

Main pedestrian access pathways

The widest pathway(s) of width not less than 2m for pedestrian circulation from building main entrance(s) to *site* entrance(s) or amenities within the *Site*

Core amenities

Basic services/ recreational facilities that are most vital and essential to the subject development

Public realm

Public spaces within and surrounding the *Site* for socialization and enjoyment by the community

Cultural heritage

Declared monuments/ Grade 1 to Grade 3 historic buildings confirmed by the Antiquities Advisory Board (AAB) and other *sites*/ historic buildings proposed to be recorded/ graded by AAB.

Girth

Diameter of a tree trunk measured at 1.3 m above ground; or refers as Diameter at Breast Height (DBH)

Albedo

The proportion of incident radiation reflected by a system. A perfect reflector would have an albedo of 1, whereas a perfect absorber would have an albedo of 0.

Wind tunnel**Computer Fluid Dynamics****Intra-Urban Heat Index****Sustainable Building Design (SBD) Guidelines**

A guideline, promulgated by the Buildings Department, on building design which aim to enhance the quality and sustainability of the built environment in Hong Kong.

Solar Reflectance Index (SRI)

The Solar Reflectance Index (SRI) is a measure of the solar reflectance and emissivity of materials that can be used as an indicator of how hot they are likely to become when solar radiation is incident on their surface. The lower the SRI, the hotter a material is likely to become in the sunshine.

Site velocity ratio (SVR)**Local velocity ratio (LVR)****Runoff coefficient**

A dimensionless coefficient relating the amount of runoff to the amount of precipitation received. It is a larger value for areas with low infiltration and high runoff (pavement, steep gradient), and lower for permeable, well vegetated areas (forest, flat land).

Permeability coefficient

A measure of a material's capacity to transmit water. It is defined as a constant of proportionality relating the specific discharge of a porous medium under a unit hydraulic gradient. Hydraulic conductivity is another term for coefficient of permeability.

Bioretention facilities

Bioretention facilities filter rainwater that becomes polluted as it flows over hard surfaces like streets, parking lots, roofs, and driveways. The bioretention facility retains the water and filters various pollutants.

Biophilic design

Designing for people as a biological organism, respecting the mind-body systems as indicators of health and well-being in the context of what is locally appropriate and responsive.

Environmental Management Plan (EMP)

An Environmental management plan is a plan to address the potential significant environmental aspects and impacts and to propose appropriate mitigation measures for construction works.

Environmental monitoring and auditing plan (EM&A)

EM&A aims to provide systemic procedures for monitoring, auditing and minimizing environmental impacts associated with Project activities.

Multi-disciplinary design *charrette*

An intensive, multiparty workshop that brings people from different disciplines and backgrounds together to explore, generate, and collaboratively produce design options.

Master Plan

The masterplan design that certified under BEAM Plus Neighbourhood certification, that has a validity of 5 years and is “scheme sensitive”.

Roll-out plan

The Rollout Plan describes the overall plan for the attaining BEAM Plus EB certification. The plan is an increment-based approach that includes specific tasks, actions, milestones, and action parties.

Whole-systems thinking

A method of analysis and decision-making that looks at the interrelationships of the constituent parts of a system rather than narrowly focusing on the parts themselves.

“simple box” environmental/ energy modelling

A simple basecase energy analysis that informs the team about the building’s likely distribution of energy consumption and is used to evaluate potential project energy strategies. A simple box analysis uses a basic, schematic building form. Also refers as “building-massing modelling”.

Functional program

A functional program describes the requirements which a building must satisfy in order to support and enhance human activities. The program also defines the character, services, scope, functions and space requirements.

Commercial Building

Commercial Building means a building, or that part of the building, intended to be used for business, trade or entertainment, for example office, clubhouse and retail.

Hotel Building

Hotel Building means a building intended to be used for habitation. The entire building is under single ownership, for example hotel, service apartment and dormitory.

Educational Building

Educational Building means a building intended to be used to fulfill educational purposes, for example kindergarten, primary school, secondary school and universities.

Residential Building

Residential Building means a building intended to be used for habitation. The building is under multiple ownerships.

Other Building Type

Other Building Type include, but not limited to, government building, industrial building, data centre, pump house, hospital, library, museum and law court.

Normally occupied spaces

Normally occupied spaces are enclosed areas where people normally stay more than 1 hour. Spaces which are not used daily, but will be occupied for more than one hour when used, are considered normally occupied spaces. Refer to Appendix 9.4 for examples of regularly occupied spaces.

Not normally occupied spaces

Not normally occupied spaces are enclosed areas within the building where people normally stay less than 1 hour. Refer to Appendix 9.4 for examples of not normally occupied spaces.

Unoccupied spaces

Unoccupied spaces are areas within the building where the primary function is not intended for human activities. These spaces are occupied

by occupants for a short period of time and only occasionally. Refer to Appendix 9.4 for examples of unoccupied spaces.

Air Ventilation Assessment

Air Ventilation Assessment, in accordance with ETWB Technical Circular No. 1/06, is a tool to assess the impacts of the proposal on the pedestrian wind environment.

Charrette

Charrette, a design workshop to quickly generate a design solution while integrating the aptitudes and interests of project team and core design disciplines, shall be held no later than design development phase and preferably during schematic design.

Certificate Validity

Certificate Validity refers to the duration for which a BEAM Plus certificate and grading remain effective and officially recognized by the HKGBC.

Global Warming Potential

Global Warming Potential, GWP, provides a measure of the potential for damage that a chemical has relative to one unit of carbon dioxide, the primary greenhouse gas.

Site

Site refers to the land, water, vegetation and developable area that constitute the project application *site* within BEAM Plus assessment boundary.

Brownfield

Brownfield refers to previously developed land, or land that contains or contained permanent structures and associated infrastructures.

Interior general Lighting

Interior general Lighting, lighting that provides a substantially uniform level of illumination throughout an area. General lighting shall not include decorative lighting or lighting that provides a dissimilar level of illumination to serve a specialized application or feature within such area.

Orientation

Orientation is the compass direction the facade faces

Open planned design

Open plan is the design for any floor plan which makes use of large, open spaces and minimizes the use of small, enclosed rooms such as private offices

External Shading

External shading is a device incorporated in the building facade to limit the internal heat gain resulting from solar radiation.

Facade Zone

The projection of the curtain wall system from the outer face of the structural elements does not exceed 200 mm for a domestic building and 250 mm for a non-domestic building

Occupied Space (Habitable Space)

Enclosed space intended for human activities, excluding those spaces that are intended primarily for other purposes, such as storage rooms and equipment rooms, and that are only occupied occasionally and for short periods of time. Occupied spaces are further classified as regularly occupied or nonregularly occupied spaces based on the duration of the occupancy, individual or multioccupant based on the quantity of occupants, and densely or nondensely occupied spaces based on the concentration of occupants in the space.

South orientated facade

For building elevation plan that is within 15deg of true south. Building elevation plan that partly fall into the range of 15deg of true south, the entire elevation will be considered as south orientated facade.

9 Appendices

9.2 EU 2 Path 1 (Performance Approach)

Whole Building Energy Simulation is required for Path 1 the Building Enapproach credit compliance. Both the baseline building model and the proposed building model must cover all building energy components listed in this appendix. The simulation models for calculating the baseline and proposed case building should be developed in accordance with the modeling methodology and the requirements per building category in the following Table-App 1 - 4.

Energy Modeling Methodology

The simulations for the proposed model and baseline model must be calculated using:

- (i) the same software
- (ii) the same weather data
- (iii) the same operating schedules; unless justification is provided through Exceptional Calculation Method (ECM). Otherwise, default operation schedule in Table 4 shall be used..
- (iv) the same occupancy density
- (v) the same building design in terms of shape
- (vi) the same outdoor and indoor design conditions, and
- (vii) the same internal illuminance levels (lux) for space lightings
- (viii) the same **thermal block** based on similar internal load densities, occupancy, lighting, thermal and space temperature schedules, and in combination with the following guidelines:
 - Separate thermal blocks should be assumed for interior and perimeter spaces. Interior spaces should be those located greater than 5m from an exterior wall. Perimeter spaces should be those located within 5m of an exterior wall.
 - Separate thermal blocks should be assumed for spaces adjacent to glazed exterior walls; a separate zone should be provided for each *orientation*, except that *orientations* that differ by less than 45 degrees may be considered to be the same *orientation*. Each zone should include all floor area that is 5m or less from a glazed perimeter wall, except that floor area within 5m of glazed perimeter walls having more than one *orientation* should be divided proportionately between zones.
 - Separate thermal blocks should be assumed for spaces having floors that are in contact with the ground or exposed to ambient conditions from zones that do not share these features.
 - Separate thermal blocks should be assumed for spaces having exterior ceiling or roof assemblies from zones that do not share these features

Table-App 1 Modeling Requirements for Calculating Proposed and Baseline Building Performance

Baseline case	Proposed case
Building Envelope	
<p>a. <i>Orientation</i>: The baseline case shall be generated by simulating the building with its actual <i>orientation</i> and again after rotating the entire building 90, 180, and 270 degrees, then averaging the results.</p> <p>b. <i>External Shading</i>: No shading projections shall be modelled; No manual window shading devices shall be modelled.</p> <p>c. Infiltration: Operable window: 1L/s/m², pressure at 75Pa accordance with NFRC 400 or ASTM E283¹ Curtain wall and glazed shop front: 0.3L/s/m², pressure at 75Pa accordance with NFRC 400 or ASTM E283</p>	<p>a. All components of the building envelope in the proposed case shall be modelled as shown on design documents (or as-built for existing building envelopes)</p>
Residential Building & Residents’ Recreational Facilities (RRF)	
<p>a. Above grade Wall & Roof: Create baseline opaque thermal properties for assessed building that just meet the regulatory requirement [2] RTTV_{wall}: 14W/m²; RTTV_{roof}: 4W/m², AND if applicable OTTV_{RRF, tower}: 24W/m²; OTTV_{RRF, podium}: 56W/m²</p> <p>b. Below grade Walls: Modelled identically with the proposed case</p> <p>c. The baseline shall be developed from the proposed building envelope design for the above target with below steps: Step 1: No shading projections shall be modelled; No manual window shading devices shall be modelled. Step 2: Exclude roof insulation Step 3: Adjust the window-to-wall area ratio (WWR) to achieve the targeted OTTV value, Step 4: If OTTV targeted value cannot be achieved under 80% WWR, relax the glazing SC value. The final SC value shall not be greater than 0.65.</p> <p>d. If there is existing building envelopes, the model shall reflect the existing conditions prior to any revision that are part of the scope of work being evaluated</p>	<p>a. All components of the building envelope in the proposed case shall be modelled as shown on design documents (or as-built for existing building envelopes). This included: Building geometry and window design Albedo of the envelope Thermal properties for the external walls, roof, floors and fenestrations (vertical fenestration and skylight) SC and VLT for fenestrations</p> <p>b. No manual fenestration shading devices such as blinds or shades shall be modelled. Automatically controlled fenestration shades or blinds might be modelled with creditable documentation provided.</p> <p>c. Permanent shading devices such as fins, overhangs and light shelves may be modeled.</p>

1 ANSI/ASHRAEIES Standard 90.1-2016 – Energy Standard for Buildings Except Low-Rise Residential Buildings
 2 Buildings Department – PNAP APP-156 – Design and Construction Requirements for Energy Efficiency of Residential Buildings; AND Buildings Department – Guideline on Design and Construction Requirements for Energy Efficiency of Residential Buildings 2014

Baseline case	Proposed case
Commercial buildings, Hotel Building & all other building types	
<p>a. Above grade Walls & Roof: Create a baseline that just meet the regulatory requirement [3]</p> <p style="padding-left: 40px;">OTTV_{tower}: 24W/m²; OTTV_{podium}: 56W/m²</p> <p>b. Below grade Walls: modelled identically with the proposed case</p> <p>c. The baseline shall be developed from the proposed building envelope design for the above target with below steps:</p> <p style="padding-left: 40px;">Step 1: Exclude any external shading device</p> <p style="padding-left: 40px;">Step 2: Exclude roof insulation</p> <p style="padding-left: 40px;">Step 3: Adjust the window-to-wall area ratio (WWR) to achieve the targeted OTTV value,</p> <p style="padding-left: 40px;">Step 4: If OTTV targeted value cannot be achieved under 80% WWR, relax the glazing SC value. The final SC value shall not be greater than 0.65.</p> <p>d. Existing building envelopes shall reflect the existing conditions prior to any revision that are part of the scope of work being evaluated</p>	<p>d. All components of the building envelope in the proposed case shall be modelled as shown on design documents (or as-built for existing building envelopes). This included:</p> <p style="padding-left: 40px;">Building geometry and window design</p> <p style="padding-left: 40px;">Albedo of the envelope</p> <p style="padding-left: 40px;">Thermal properties for the external walls, roof, floors and fenestrations (vertical fenestration and skylight)</p> <p style="padding-left: 40px;">SC and VLT for fenestrations</p> <p>e. No manual fenestration shading devices such as blinds or shades shall be modelled. Automatically controlled fenestration shades or blinds might be modelled with creditable documentation provided.</p> <p>f. Permanent shading devices such as fins, overhangs and light shelves may be modeled.</p>

Baseline case	Proposed case
Interior General Lighting System	
<p>Lighting that provides a substantially uniform level of illumination through an area. General lighting shall not include decorative lighting or lighting that provides a dissimilar level of illumination to serve a specialized application or feature within such area. All installed lighting shall be modelled in each thermal block.</p> <ol style="list-style-type: none"> 1. Lighting Power shall be determined in space by space method with same categorization as the proposed design. 2. Lighting system power shall include all lighting system components shown or provided for on the plans for background lighting. Lighting system that solely use for emergency purpose is not in scope. 3. Lighting power shall include all power used by the luminaires, including lamps, ballasts, transformers and control devices. 4. Any independently operating lighting systems in a space that are capable of being controlled to prevent simultaneous user operation, the installed interior lighting power shall be based solely on the lighting system with the highest wattage 5. Lighting equipment that additional to general lighting requirement for a space and is controlled by an independent control device is not included. 6. Lighting that is integral to equipment or instrumentation and is installed by its manufacturer is not included in this assessment methodology 7. For space that the completed fixed lighting installations in the space does not exceed 70W, baseline shall be modelled as 70W in the space 8. Lighting installations in BEC TG-2015 ver.0 [4] clauses 5.1.2 are excluded. 9. Automatic lighting control shall be modelled in the baseline case in accordance to BEC2015 ver.0 [5] table 5.4 and clauses 5.6. Residential dwelling unit is excluded from this requirement. <p>Exceptions: emergency lighting that is automatically off during normal building operation; lighting that is specially designated as required by a health or life safety statute, ordinance, or regulation</p>	
Residential Building	
<ol style="list-style-type: none"> a. The lighting power density within the dwelling unit shall be set equal to the below: <ul style="list-style-type: none"> Bedroom: 13 W/m² Living Room/ Dining Room: 15 W/m² Kitchen: 13 W/m² Bathroom: 13W/m² <p>*For <u>any other</u> space type in the building, please refer to BEC 2015 Table 5.4 maximum allowable Lighting Power Density (LPD).</p> b. Lighting Control shall be included to reflect the mandatory control requirements in BEC 2015 for spaces other than dwelling units in a building. c. Daylight responsive control shall be modelled for the space (other than dwelling units) with fenestration area exceeding 5 sq.m and with lighting electrical consumption at 150W and 	<ol style="list-style-type: none"> a. Dwelling Unit where a complete lighting system designed (or installed) shall be consistent with design documents (or actual equipment used). b. Dwelling Unit where a lighting system neither exists nor is specified in a space, lighting power shall be modelled identically with the baseline case, unless a legal bounding agreement is provided for the future users. c. For other spaces where a complete lighting system designed (or installed) shall be consistent with design documents (or actual equipment used) d. For other spaces where a lighting system neither exists nor is specified in a space, lighting power shall be modelled identically with the baseline case. e. For automatic lighting controls in addition to those mandatory requirements in BEC 2015, Exceptional Calculation Method (ECM) is

4 Technical Guidelines on Code of Practise for Energy Efficiency of Building Services Installation 2015 (Ver. 0) – Electrical and Mechanical Services Department HKSAR

5 Code of Practise for Energy Efficiency of Building Services Installation (Ver.0) – Electrical and Mechanical Services Department HKSAR

Baseline case	Proposed case
<p>above. 50% of reduction in perimeter zone is required in response to daylight.</p> <p>d. Automatic lighting control (occupancy sensor) for space (other than dwelling unit) with lighting electrical consumption at 150W and above. 50% of reduction in perimeter zone is required</p> <p>e.</p>	<p>required to justify the modification of lighting schedules uses for the proposed case. Credible technical documentation for the modification shall be provided.</p>
Commercial Buildings, hotels & other building types	
<p>a. Lighting power shall be modelled with reference to the maximum allowable LPD in BEC 2015 Table 5.4</p> <p>b. For space that that cannot be determined from the BEC 2015 Table 5.4, LPD could be advised by professional and justification shall be provided for advanced approval.</p> <p>c. Daylight responsive control shall be modelled for the space with fenestration area exceeding 5 sq.m and with lighting electrical consumption at 150W and above. 50% of reduction in perimeter zone is required in response to daylight.</p> <p>d. Automatic lighting control (occupancy sensor) for space with lighting electrical consumption at 150W and above. 50% of reduction in perimeter zone is required</p>	<p>a. For spaces where a complete lighting system designed (or installed) shall be consistent with design documents (or actual equipment used)</p> <p>b. For spaces where a lighting system neither exists nor is specified in a space, lighting power shall be modelled identically with the baseline case, unless a legally bounding documents for future use is provided to justify the input.</p> <p>c. For automatic lighting controls in addition to those mandatory requirements in BEC 2015, ECM is required to justify the modification of lighting schedules uses for the proposed case. Credible technical documentation for the modification shall be provided.</p>
Receptacle and Other Load (Process Load)	
<p>Energy for receptacle, and process loads (unregulated load) shall be modelled with respect to building type. Process load shall be input as per design information to reflect the expected energy consumption. Justification shall be provided by applicant through ECM. If no information could be provided, default power density shall be used for the below space type⁶</p> <p style="padding-left: 40px;">Office: 25W/m²</p> <p style="padding-left: 40px;">Retail: 15W/m²</p> <p style="padding-left: 40px;">For retail shop that might include refrigeration equipment, cooking and food preparation, clothes washing and other major support appliances, pre-defined value in LEED v4 Appendix 3 Table 1-4 shall be used.</p> <p style="padding-left: 40px;">Grocery Store: 27W/m²</p> <p style="padding-left: 40px;">Residential Unit, Hostel, Dormitory: 0.25W/m²</p> <p style="padding-left: 40px;">Hotel Guest Room: 900W/room</p> <p style="padding-left: 40px;">Classroom / Lecture theatre: 10W/m²</p> <p style="padding-left: 40px;">Data Centre: 900W/m²</p>	

6 LEED 2009 Appendix 2, Table 1, LEED v4 Appendix 3, Table 1-4 and EMSD - Performance-based Building Energy Code 2007 "Space type categories: default assumptions"

Baseline case	Proposed case
<p>a. Receptacle and process loads shall be estimated based on the building type or space type category and shall be assumed to be identical in the proposed and baseline case, unless advance approved by ECM</p>	<p>a. Receptacle and process loads shall be input as design information with supporting through ECM; if no information could be provided, default value shall be used.</p> <p>b. Both baseline and proposed case shall be modelled identically, including power, schedule and control.</p> <p>c. If both cases are not identical, submission of ECM is required to support the justification by professional with</p>
<p>Miscellaneous</p>	
<p>Miscellaneous energy uses are defined as those that may be treated separately since they have little or no interaction with the conditioned thermal blocks or the HVAC systems that serve them.</p> <ul style="list-style-type: none"> • Exterior Lighting System • Services Hot Water System • Lift & Escalator System • Irrigation, plumbing and drainable, fire services 	
<p>Exterior Lighting System</p>	
<p>a. Where exterior lighting system has been specified (or installed) in the proposed case, the system shall be modelled identically with the proposed case.</p> <p>b. Where no exterior lighting has been specified in proposed case, no exterior lighting shall be modelled</p>	<p>a. When exterior lighting system has been specified (or installed) in the proposed case, the system shall be modelled consistent with design documents (or actual system information)</p> <p>b. Where no exterior lighting has been specified in proposed case, no exterior lighting shall be modelled.</p>
<p>Services Hot Water System</p>	
<p>For a combination of equipment and auxiliary devices (e.g. controls, accessories, interconnecting means and terminal elements) by which energy is transformed so it heats up water for domestic or commercial purpose other than space heating and process requirements.</p>	
<p>a. Where service hot-water system has been specified (or installed) in the proposed case, the system shall be sized identical to the proposed case, where energy source shall be electrical heater. Efficiency for the water heater shall be 80%.</p> <p>b. Where no service hot water system has been specified but the building will have service hot-water loads, a service water system using electrical heater shall be used. Efficiency for the water heater shall be 80%</p> <p>c. For buildings that will have no service hot-water loads, no service hot-water heating shall be modelled</p> <p>d. Service hot-water energy consumption shall be calculated explicitly based upon the volume of service hot water required and the entering makeup water and the leaving service hot-water temperatures. Leaving temperature shall be based upon the end-use requirements in proposed case.</p>	<p>a. Where a service hot-water system has been specified (or installed) in the proposed case, the system shall be modelled consistent with design documents (or actual system information).</p> <p>b. Where no service hot water system has been specified but the building will have service hot water loads, a service water system shall be modelled identical to the baseline case</p> <p>c. For building that will have no service hot-water loads, no service hot-water heating shall be modelled.</p>

Baseline case	Proposed case
e. Service water loads and usage shall be the same for both the baseline case and the proposed case.	
Lift and Escalator System	
a. With reference to proposed design equipment rank, input by identifying each corresponding maximum allowable electrical power according to Section 8.4 in BEC 2015 ver.0.	a. Where lift and escalator system has been specified (or installed), the system shall be modelled consistent with design documents (or actual system information) b. For controls in addition to those mandatory requirements in BEC 2015, ECM is required to justify the modification of lift schedules uses for the proposed case. Credible technical documentation for the modification shall be provided.
Irrigation, Plumbing and Drainage, Fire Services	
a. No system to be modelled	a. No system to be modelled
On-site Power Generation	
a. No on-site power generation to be modelled	a. Where an on-site power generation system has been specified (or installed) in the proposed case, the system shall be modelled consistent with design documents (or actual system information)

Baseline Case	Proposed case
HVAC system	
1. General <ul style="list-style-type: none"> - Weather conditions used in sizing runs to determine baseline equipment capacities maybe based either on hourly historical weather files containing typical peak conditions or on design days developed using 99.6% heating design temperatures and 1% dry-bulb and 1% wet bulb cooling design temperature - Outdoor condition to be used for both baseline and proposed case sizing shall reference to BEC 2015 Table 6.4. - Indoor condition (s) to be used for both baseline and proposed case shall be identical. Justification shall be provided else value in BEC 2015 Table 6.4 shall be used. 	
2. All conditioned spaces in the proposed design should be simulated as being both heated and cooled even if no heating or cooling system is to be installed and temperature and humidity control set points and schedules should be the same for proposed and baseline building designs unless justification is provide through ECM calculation.	
3. The HVAC system(s) in baseline building design shall be of the type and description specified in Table 2 "Baseline HVAC System Setting Summary".	
4. Equipment Efficiencies All HVAC equipment in the baseline case shall be modelled at the minimum efficiency levels, both part load and full load, in accordance with BEC 2015 ver.0 Table 6.12a (Part 1) and Table 6.12b. All HVAC equipment in the proposed case shall be modelled consistent with design documents (or actual installed equipment information)	

Baseline Case	Proposed case
<p>In both baseline and proposed case, for package type system the descriptor shall be broken down into its components so that supply fan energy can be modelled separately</p> <ol style="list-style-type: none"> 5. Equipment Capacities The equipment capacities for the baseline case shall be based on sizing run and shall be oversized by 15% for cooling. 6. Minimum outdoor air ventilation rate shall be modelled identical in both baseline and proposed case. 7. Demand control is required in baseline case conditioned area when a space with design fresh air flow rate \geq 1400 L/s 8. Design airflow rates for the baseline case shall be based on a supply-air-to-room-air temperature difference of 11°C or the required ventilation air or makeup air, whichever is greater. If return or relief fans are specified in the proposed case, the baseline case shall also be modelled with fans serving the same functions and sized for the baseline supply fan air quality less the minimum outdoor air, or 90% of the supply fan air quantity, whichever is larger 9. Design chilled water temperature to be used in the baseline case shall reference to the corresponding value in BEC 2015 Table 6.12b (7°C / 12.5°C) 10. Chilled water pump shall be modelled as 65% combined impeller and motor efficiency for baseline case 11. Performance impact due to pipe / duct loses and refrigerant pipe length are not considered in this assessment methodology 12. Existing equipment shall be modelled identical in both baseline and proposed case. The corresponding energy consumption shall be separately metered. 	
<p>Residential Building</p>	
<p>(i) Public housing:</p> <ol style="list-style-type: none"> a. Space: residential unit, common area and recreational facilities area (e.g. communal area) should be modelled with unitary (non-split type) unit. b. Space: kitchen and toilet should be modelled with mechanical ventilation only. Mechanical fans should be 1.1W/L/s of exhaust air flow rate *Calculation method refer to Section 6.7.6.1 in BEC 2015 ver.0. 	<p>(i) Public housing:</p> <ol style="list-style-type: none"> a. Space where complete HVAC system has been designed (or installed), the model shall consistent with design documents (or actual system type used). b. Space where no HVAC system has been designed (or installed) but AC platform is designed for future provision, the HVAC system should be identical to the system modelled in baseline (unitary, non-split type) Exception: if natural ventilation design and provision is provided, justification is required through ECM calculation to demonstrate the number of non-AC hours (with reference to ASHRAE 62.1-2013) that complied with design condition for natural ventilation. c. Space where no HVAC system has been designed (or installed) and no AC platform is designed for future provision, no HVAC system has to be modelled.
<p>(ii) Private housing:</p> <ol style="list-style-type: none"> a. Space: residential flat, common area and recreational facilities area (e.g. club house) should be modelled with unitary (split type) unit b. Space: kitchen and toilet should be modelled with mechanical ventilation only, Mechanical fans should be 1.1W/L/s of exhaust air flow rate *Calculation method refer to Section 6.7.6.1 in BEC 2015 ver.0. 	<p>(ii) Private housing:</p> <ol style="list-style-type: none"> a. Space where complete HVAC system has been designed (or installed), the model shall consistent with design documents (or actual system type used). b. Space where no HVAC system has been designed (or installed) but AC platform is designed for future provision, the HVAC system should be identical to the system modelled in baseline (unitary (split type)

Baseline Case	Proposed case
	<p>Exception: if natural ventilation design and provision is provided, justification is required through ECM calculation to demonstrate the number of non-AC hours that complied with design condition (with reference to ASHRAE 62.1-2013) for natural ventilation.</p> <p>c. Space where no HVAC system has been designed (or installed) and no AC platform is designed for future provision, no HVAC system has to be modelled.</p>
Commercial, hotels, educational and other building types	
<p>(iii) Commercial, hotels, educational and other buildings with air conditioned floor area < 14,000 sqm</p> <p>a. Conditioned space should be modelled with Unitary air-conditioner –split type unit</p> <p>b. Non-conditioned space should be modelled with mechanical ventilation only, Mechanical fans should be 1.1W/L/s of exhaust air flow rate</p> <p style="padding-left: 40px;">*Calculation method refer to Section 6.7.6.1 in BEC 2015 ver.0.</p>	<p>(iii) Commercial, hotels, educational and other buildings with air conditioned floor area < 14,000 sqm</p> <p>a. Space where complete HVAC system has been designed (or installed), the model shall consistent with design documents (or actual system type used).</p> <p>b. Space where no HVAC system has been designed (or installed) but AC platform is designed for future provision, the HVAC system should be identical to the system modelled in baseline (Unitary air-conditioner – non-split type unit)</p> <p>Exception: if natural ventilation design and provision is provided, justification is required through ECM calculation to demonstrate the number of non-AC hours that complied with design condition (with reference to ASHRAE 62.1-2013) for natural ventilation. The corresponding design shall be equipped with automatic change over provision.</p> <p>c. Space where no HVAC system has been designed (or installed) and no AC platform is designed for future provision, no HVAC system has to be modelled.</p>
<p>(iv) Commercial, hotels, educational and other buildings with air conditioned floor area ≥ 14,000 sqm</p> <p>a. Conditioned space should be modelled with VAV system with reheat.</p> <p>b. Supply fan system shall be 2.1W/L/s</p> <p style="padding-left: 40px;">*Calculation method based on description stated in Section 6.7.3 and 6.7.5 in BEC 2015 ver.0.</p> <p>c. Non-conditioned space should be modelled with mechanical ventilation only, Mechanical fans should be 1.1W/L/s of exhaust air flow rate</p> <p style="padding-left: 40px;">*Calculation method refer to Section 6.7.6.1 in BEC 2015 ver.0.</p> <p>d. Chiller configuration shall meet the specific requirements in Table 3</p>	<p>(iv) Commercial, hotels, educational and other buildings with air conditioned floor area ≥ 14,000 sqm</p> <p>a. Space where complete HVAC system has been designed (or installed), the model shall consistent with design documents (or actual system type used).</p> <p>b. Space where no HVAC system has been designed (or installed) but AC platform is designed for future provision, the HVAC system should be identical to the system modelled in baseline (unitary (split type)</p> <p>Exception: if natural ventilation design and provision is provided, justification is required through ECM calculation to demonstrate the number of non-AC hours that complied with design condition (with reference to ASHRAE 62.1-2013) for natural ventilation. The corresponding design shall be equipped with automatic change over provision.</p>

Baseline Case	Proposed case
District cooling system (if applicable)	
<p>a. Set-up a virtual main plant based on building cooling load:</p> <p style="padding-left: 20px;">< 2000kW: 2 water cooled centrifugal chillers with same capacity</p> <p style="padding-left: 20px;">2000 ≤ cooling load < 9000kW: no chiller larger than 1000kW & all sized equally</p> <p style="padding-left: 20px;">≥ 9000kW: no chiller larger than 3000kW & all sized equally</p> <p>b. Performance of individual components refer to BEC 2015 ver.0 Table 6.12b</p> <p>c. Virtual primary variable pumping system shall be included</p>	<p>a. Based on actual efficiency performance; or</p> <p>b. If project team cannot obtain actual performance data for main plant, it is permissible to use the following default average performance values:</p> <p style="padding-left: 20px;">DCS cooling plant – COP of 4.4 for total cooling plant average efficiency (including cooling towers and primary pumps)</p> <p>c. Seasonal Thermal distribution losses – including minor leaks and condensate losses (but not pumping energy, which must be accounted for separately where it applies): chilled water district cooling: 5%</p>
Ventilation System	
<p>Carpark ventilation (if applicable) shall be operated with staging of fans, provide down to 50% less of the design capacity</p> <p style="padding-left: 20px;">*Calculation method based on description stated in Section 6.10.7 in BEC 2015 ver.0.</p>	<p>Carpark ventilation shall be consistent with design documents (or actual system installed)</p>

Table-App 2 Baseline HVAC System Setting Summary

	Public Housing	Private Housing	Commercial, hotels, educational and Other building types with air conditioned floor area < 14,000 sqm	Commercial, hotels, educational and Other building types with air conditioned floor area ≥ 14,000 sqm		Any Building types that used district cooling system (DCS)
Cooling Generation	Unitary air-conditioner – non-split type	Unitary air-conditioner – split type	Unitary air-conditioner – split type	Chiller		District Chiller plants
Heating Generation	Unitary air-conditioner – non-split type	Unitary air-conditioner – split type	Unitary air-conditioner – split type	Electric Resistance		Hot water fossil fuel boiler

wk = Weekday

1. Elevator schedules, except for restaurants, are from the U.S. Department of Energy Standard Evaluation Techniques, except they have been changed to 0% when occupancy is 0%. These values may be used only if actual schedules are not known.

2. Lighting profiles are modified to reflect the requirement for occupancy sensors in space. For parking garage lighting, the schedule has been revised to accompany the office schedule: the lighting in the parking garage is set to be on at 100% for all hours when the building occupancy is 10% or greater, but reduced to 50% for all hours when the building occupancy is less than 10%. For other uses, it is acceptable to modify the parking garage schedule to parallel that use.

wk = Weekday

1. Elevator schedules, except for restaurants, are from the U.S. Department of Energy Standard Evaluation Techniques, except they have been changed to 0% when occupancy is 0%. These values may be used only if actual schedules are not known.

2. Lighting profiles are modified to reflect the requirement for occupancy sensors in space.

9.3 Eu 2 Path 2 (Prescriptive Approach)

When outdoor conditions are suitable, natural ventilation, as oppose to mechanical cooling, can be used to remove heat gains and pollutants from buildings. This reduces energy consumption.

The wind availability at a window is determined by *site* massing and neighbourhood massing which are addressed elsewhere in this guidance. It is not the intention of this credit to assess the natural ventilation potential in a specific wind environment, simply to give designers a tool to optimise window design and spatial to achieve good natural ventilation.

Acoustic windows calculation should be accounted with reference to APP 130 (2/2015) Section 6.

Cross Ventilation Requirements

Units can be considered to have good cross ventilation when the air flow path between facade openings is relatively unobstructed.

Design should demonstrate cross ventilation enhancement consideration by below design principle:

Openable windows can be located in different habitable areas, e.g. living room and bedroom or on differently orientated facades of the same habitable area.

The cross ventilation path between openings should be one turn only, from the middle of one window to another; (Figure 1 & 3)

The angle of turn for the cross ventilation path at the joint of the two lines should not be greater than 90°; (Figure 2 & 3)

Cross ventilation path shall not be more than 12m in length for each habitable area (Figure 3)

✘ No more than one turn allowed

Figure 1

✘ Angle of turn, β , should not be greater than 90°

Figure 2

Figure 3

In each habitable area, total physical openings area (i.e. not aerodynamic free area) should be double of that of the statutory requirement (i.e. 1/8 of openable window area to usable floor area);

When considering a single room, the openable window size located at each wall should be at least 1/16 of the usable floor area;

To ensure cross ventilation can affect the majority of the *habitable space*, it is required to have the windows a reasonable distance apart. To assess this, draw the smallest box possible that covers the habitable area and divide into equal halves through the longest side. The windows shall lie in different halves of the habitable area. (Figure 4)

For windows located within Re-entrants

Concave areas of buildings with width greater than 4.5m will typically have similar flow characteristics to the free-stream. Hence, for the purpose of ventilation, a re-entrant begins when a concaved area has width less than 4.5m. This can be defined graphically by a plane of 4.5m wide (referred to as the External Plane, (ExP), extending from infinity towards a concave area: the re-entrant begins where such a plane can no longer pass through.

A secondary opening located in the re-entrant may still achieve satisfactory cross-ventilation performance provided that the re-entrant is sufficiently wide and the window is located relatively close to the beginning of the re-entrant. Such an acceptable window can be defined by connecting a plane of 2.3m width and 4.5m length (referred to as Secondary Window Plane, (SWP) to ExP. Windows that can be reached by SWP are considered acceptable secondary windows.

For the purpose of this assessment, the effective area of an apartment can be extended by the concept of a “notional” area. Such a notional area can be defined by connecting a Notional Plane (NP) of 1.5m width from SWP to a secondary window. The conditions for demonstrating cross ventilation explained above now cover NOT only the actual residential unit, but also the notional area together, i.e. the ventilation path is measured from the primary window to the SWP, See Figure 5

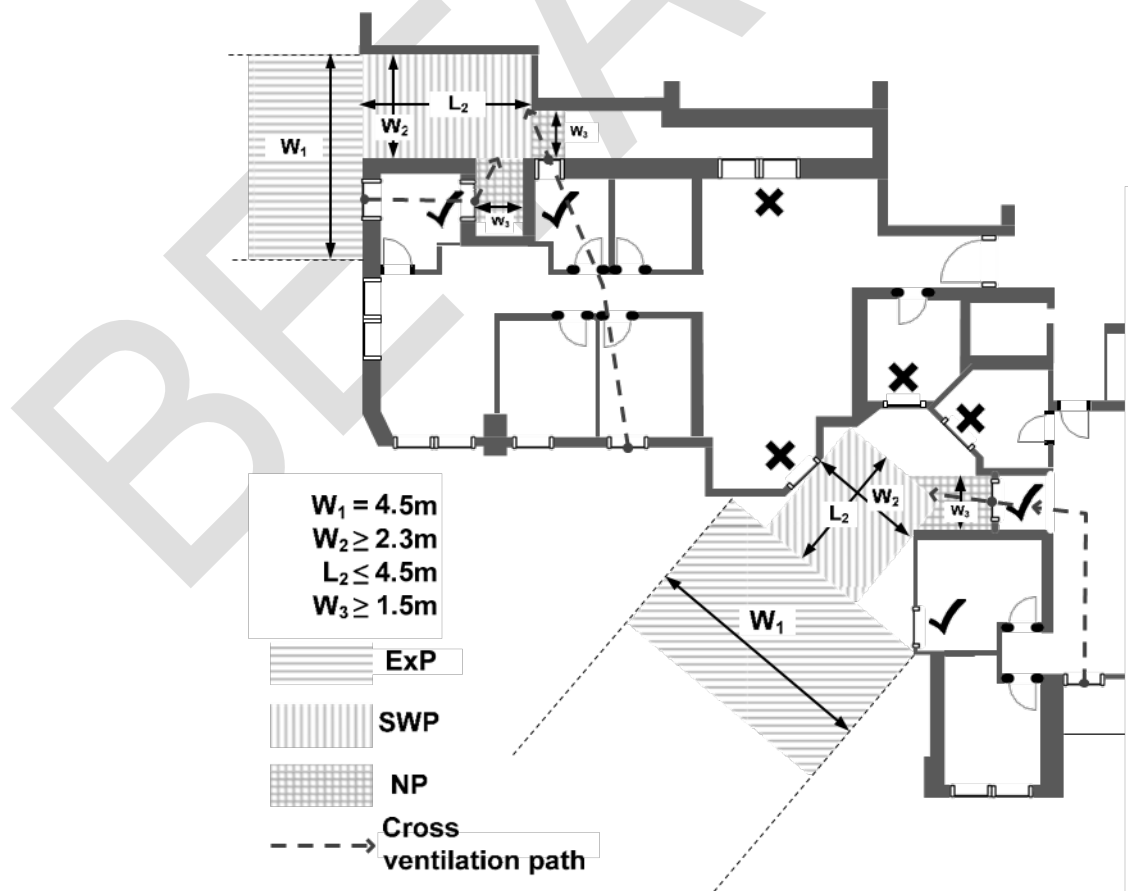

Figure 5 Allowable locations of windows in re-entrants

Single Side Ventilation Requirements

Units can be considered to have good single sided ventilation when the ventilated space is sufficiently small to allow for air exchanges resulting from turbulent fluctuations in the wind which induce pressure differentials across openings or stack effects. The following criteria set out guidelines to achieve single side ventilation requirements.

The window will ventilate up to 4.5m from opening area, the area under question shall be contained within this zone. (Figure 6)

Figure 6 Room ventilation zone

At least two separated openable window panes should be located at same wall or different walls for single sided ventilation; and

The total physical openings area (i.e. not aerodynamic free area) in each habitable area shall be at least 1/5 openable window of the usable floor area.

9.4 Space type

BEAM Plus considers indoor environmental quality (IEQ) as a key to sustain occupants' health and wellbeing. To assist the applicant design more thorough and satisfactory IEQ strategies, BEAM Plus imposes high requirements for indoor environmental quality covering ventilation, air quality, acoustics and lighting.

As the impacts of IEQ are dependent on the level of interaction between the occupants and the indoor spaces where they spend their time in, it is crucial for the applicant to understand and identify the level of usage of each indoor space. To facilitate assessment, the applicant should prepare a schedule including all spaces present within the building and their respective location. The spaces should be categorised into the following three space type (refer to Glossary for definitions):

- *Normally occupied spaces*
- *Not normally occupied spaces*
- *Unoccupied spaces*

Listed below are some example of each space type. These examples are not exhaustive. If a space present in the applicant's building is not included below, the applicant should identify similar examples or categorise the space type according to the definition. Justification is required should the applicant believe a space cannot be categorised according to the space type definitions.

Space Usage of *normally occupied spaces* (alphabetical order once finalised)

- | | |
|---------------------------------------|---------------------------|
| • Auditorium | • Lecture hall |
| • Concourse | • Meeting room |
| • Conference room | • Open office |
| • Dining (commercial and residential) | • Private office |
| • Food and beverage dining area | • Reception |
| • Front desk | • Residential bedroom |
| • Gallery area | • Residential dining room |
| • Gymnasium | • |
| • Hospital patient rooms | • Residential living room |
| • Hotel guest room | • Retails |
| • Hotel entrance lobby | • School classroom |
| • Information desk | • Shipping and receiving |

- Kitchens (commercial and residential)
- Lecture hall

Space Usage of *not normally occupied spaces*

- Break room
- Copy rooms
- Corridor
- Entrance lobby (other than hotel)
- Staircases
- Main lift lobby
- Lift lobby
- Pantry
- Toilet
- Residential kitchen

Space Usage of *Unoccupied spaces*

- Emergency exit corridor
- Mechanical and electrical rooms
- Car park
- Store room
- Warehouse
